

# 2011 TECHNICAL REPORT APPENDICES

# **REGIONAL AQUATICS MONITORING PROGRAM**

## **2011 Technical Report – Appendices**

***FINAL***

*Prepared for:*

**RAMP STEERING COMMITTEE**

*Prepared by:*

**The RAMP 2011 Implementation Team**

*Consisting of:*

**HATFIELD CONSULTANTS  
KILGOUR AND ASSOCIATES LTD.  
and WESTERN RESOURCE SOLUTIONS**

**APRIL 2012**

RAMP1696

## **LIST OF APPENDICES**

- Appendix A      Estimating Area of Land Change for the RAMP Focus Study Area
- Appendix B      Quality Assurance and Quality Control Procedures for 2011
- Appendix C      Climate and Hydrology Component
- Appendix D      Water Quality Component
- Appendix E      Benthic Invertebrate Communities and Sediment Quality Component
- Appendix F      Fish Populations Component
- Appendix G      Acid-Sensitive Lakes Component

## TABLE OF CONTENTS

<b>LIST OF TABLES .....</b>	<b>iv</b>
<b>LIST OF FIGURES.....</b>	<b>vii</b>

<b>A ESTIMATING AREA OF LAND CHANGE FOR THE RAMP FOCUS STUDY AREA.....</b>	<b>A-1</b>
<b>A.1 INTRODUCTION.....</b>	<b>A-1</b>
<b>A.2 METHODOLOGY .....</b>	<b>A-1</b>
A.2.1 Satellite Imagery Acquisition.....	A-1
A.2.2 Ortho-Rectification of Image Data .....	A-1
A.2.3 Atmospheric Correction .....	A-3
A.2.4 Classification of Land Change.....	A-3
<b>A.3 RESULTS.....</b>	<b>A-3</b>
<b>B QUALITY ASSURANCE AND QUALITY CONTROL PROCEDURES FOR 2011.....</b>	<b>B-1</b>
<b>B.1 QUALITY ASSURANCE PROCEDURES.....</b>	<b>B-1</b>
B.1.1 Field Staff Training .....	B-1
B.1.2 Field Operations .....	B-2
B.1.3 Laboratory Analyses .....	B-3
B.1.4 Data Management .....	B-3
B.1.5 Sample Management .....	B-4
B.1.6 RAMP Quality Assurance Plan .....	B-4
<b>B.2 QUALITY CONTROL PROCEDURES.....</b>	<b>B-5</b>
B.2.1 Climate and Hydrology Component.....	B-5
B.2.2 Water Quality Component .....	B-6
B.2.3 Benthic Invertebrate Communities Component.....	B-33
B.2.4 Sediment Quality Component.....	B-34
B.2.5 Fish Populations Component .....	B-44
B.2.6 Acid-Sensitive Lakes Component.....	B-46
<b>C CLIMATE AND HYDROLOGY COMPONENT .....</b>	<b>C-1</b>
<b>C.1 2011 CLIMATE AND HYDROLOGY STATIONS.....</b>	<b>C-1</b>
<b>C.2 CLIMATE DATA COLLECTED IN THE 2011 WATER YEAR .....</b>	<b>C-3</b>
C.2.1 RAMP Climate Data.....	C-3
C.2.2 Climate Data from Government Agencies .....	C-16
<b>C.3 HYDROMETRIC DATA COLLECTED IN THE 2011 WY .....</b>	<b>C-19</b>
C.3.1 RAMP Hydrometric Data .....	C-19
C.3.2 Hydrometric Data from Focal Projects.....	C-24
C.3.3 Hydrometric Data from Government Agencies .....	C-24
C.3.4 2011 WY Hydrographs in Historical Context.....	C-26
C.3.5 Stage-Discharge Rating Curves .....	C-48
<b>C.4 NATURALIZED FLOW CALCULATION.....</b>	<b>C-68</b>
C.4.1 Introduction .....	C-68
C.4.2 Rationale .....	C-68
C.4.3 Water Balance Procedure.....	C-70
C.4.4 Previously Published Estimates .....	C-70

C.5	UPDATED STATION DESCRIPTION SHEETS .....	C-71
C.6	INVENTORY OF CLIMATE AND HYDROLOGIC DATA IN THE RAMP DATABASE .....	C-119
C.7	STATION VISIT RECORDS AND MANUAL MEASUREMENTS.....	C-126
C.8	2011 WATER YEAR NATURALIZED FLOW CALCULATION RESULTS .....	C-406
<b>D</b>	<b>WATER QUALITY COMPONENT .....</b>	<b>D-1</b>
D.1	ANALYTICAL CHEMISTRY METHODS .....	D-1
D.2	CALCULATED DETECTION LIMITS FOR WATERBORNE PAHS.....	D-5
<b>E</b>	<b>BENTHIC INVERTEBRATE COMMUNITIES AND SEDIMENT QUALITY COMPONENT .....</b>	<b>E-1</b>
E.1	BENTHIC INVERTEBRATE COMMUNITIES .....	E-1
E.1.1	Benthic Invertebrate Sample Processing Procedures .....	E-1
E.1.2	Calculating <i>Baseline</i> Ranges.....	E-3
E.2	SEDIMENT QUALITY COMPONENT.....	E-6
E.2.1	Analytical Methods .....	E-6
E.2.2	Predicted PAH Toxicity.....	E-7
<b>F</b>	<b>FISH POPULATIONS COMPONENT .....</b>	<b>F-1</b>
F.1	COMMON AND SCIENTIFIC NAMES FOR FISH SPECIES CAPTURED IN THE 2011 FISH POPULATIONS COMPONENT .....	F-1
F.2	EXTERNAL HEALTH ASSESSMENT INDEX CODES FOR FISH EXAMINATION.....	F-2
<b>G</b>	<b>ACID-SENSITIVE LAKES COMPONENT.....</b>	<b>G-1</b>
G.1	RUNOFF CALCULATIONS FOR EACH RAMP LAKE .....	G-1
G.2	TEST OF THE ASSUMPTION THAT CURRENT BASE CATIONS ARE SIMILAR TO HISTORIC BASE CATIONS IN THE RAMP LAKES .....	G-4
G.3	ORIGIN OF THE USE OF ANC <sub>LIM</sub> = 75 µEQ/L IN THE CRITICAL LOAD CALCULATIONS .....	G-6
G.4	COMPARISON OF RAMP LAKE CHEMISTRY IN 2011 TO REGIONAL LAKES .....	G-7
G.5	CHARACTERIZATION OF ION CHEMISTRY IN THE RAMP LAKES.....	G-11
G.6	ANALYSIS OF METALS IN THE RAMP LAKES.....	G-13

## LIST OF TABLES

Table A.3-1	Area of watersheds with land change as of 2011, summarized by land change type.....	A-4
Table A.3-2	Percent of total area of watershed with land change as of 2011, summarized by type of land change.....	A-5
Table B.2-1	Results of analysis of field blanks prepared during RAMP water quality surveys in winter, spring, summer and fall, 2011.....	B-10
Table B.2-2	Results of analysis of trip blanks prepared during RAMP water quality surveys in winter, spring, summer and fall, 2011.....	B-14
Table B.2-3	Relative percent difference between duplicate water quality samples collected from the Athabasca River (ATR-DD-E), winter 2011.....	B-18
Table B.2-4	Relative percent difference between duplicate water quality samples collected from the Athabasca River (ATR-DC-E), summer 2011.....	B-21
Table B.2-5	Relative percent difference between duplicate water quality samples collected from the MacKay River (MAR-2), fall 2011.....	B-25
Table B.2-6	Relative percent difference between duplicate water quality samples collected from the Beaver River (BER-2), fall 2011.....	B-29
Table B.2-7	Results of quality control checks on sorting efficiency of RAMP benthic invertebrate samples, 2011.....	B-34
Table B.2-8	Relative percent difference between duplicate and split sediment quality samples, lower Muskeg River (MUR-D3), September 2011.....	B-37
Table B.2-9	Relative percent difference between duplicate and split sediment quality samples, lower Ells River (ELR-D1), September 2011.....	B-39
Table B.2-10	Concentration of metals in the rinsate blank taken from sediment sampling equipment, September 2011.....	B-41
Table B.2-11	Concentration of PAHs in the rinsate blank taken from sediment sampling equipment, September 2011.....	B-43
Table B.2-12	Relative percent difference between duplicate mercury fish tissue samples collected from the Athabasca River, fall 2011.....	B-45
Table B.2-13	Relative percent difference between duplicate water quality samples collected for conventional variables from three RAMP lakes sampled in 2011.....	B-48

Table B.2-14	Percent bias between measured and theoretical values for laboratory reference standards.....	B-49
Table C.1-1	RAMP climate, hydrometric and snowcourse stations monitored in 2011.....	C-1
Table C.2-1	Data collected at the RAMP Aurora Climate Station (C1), 2011.....	C-3
Table C.2-2	Summary of monthly climate data collected at the RAMP Aurora Climate Station (C1) during the 2011 WY.....	C-4
Table C.2-3	Data collected at the RAMP Horizon Climate Station (C2), 2011.....	C-5
Table C.2-4	Summary of monthly climate data collected at the RAMP Horizon Climate Station (C2) during the 2011 WY.....	C-6
Table C.2-5	Data collected at the RAMP Steepbank Climate Station (C3), 2011.....	C-7
Table C.2-6	Summary of monthly climate data collected at the RAMP Steepbank Climate Station (C3) during the 2011 WY.....	C-8
Table C.2-7	Data collected at the RAMP Pierre Climate Station (C4), 2011.....	C-9
Table C.2-8	Summary of monthly climate data collected at the RAMP Pierre Climate Station (C4) during the 2011 WY.....	C-10
Table C.2-9	Climate data collected at other RAMP stations, 2011.....	C-11
Table C.2-10	Summary of climate data collected at RAMP stations at McClelland Lake (L1) and Kearl Lake (L2) during the 2011 WY.....	C-12
Table C.2-11	Summary of total rainfall and atmospheric pressure data collected at other RAMP stations during the 2011 WY.....	C-13
Table C.2-12	Summary of the RAMP snow course surveys organized by land cover type, winter 2011.....	C-17
Table C.2-13	Summary of the RAMP snow course surveys organized by region, winter 2011.....	C-18
Table C.3-1	Summary of RAMP hydrometric monitoring during the 2011 WY.....	C-21
Table C.3-2	Suspended sediment data collected at RAMP hydrometric stations during the 2011 WY.....	C-23
Table C.3-3	Hydrometric information for 2011 WY received from oil sands operators and incorporated into the water balance analyses.....	C-25
Table C.4-1	Area of each watershed that was cleared or hydrologically closed-circuited, 2011.....	C-69
Table C.6-1	Inventory of climate and hydrologic data collected by RAMP. ....	C-120

Table D.1-1	Analytical methods, method detection limits, and Variable Method Values (VMV codes) for water quality variables measured by analytical laboratories for RAMP in 2011.....	D-1
Table D.2-1	Original reporting limits versus blank-corrected detection limits for individual PAH species/homologues, RAMP 2011 data.....	D-6
Table E.1-1	Level of taxonomic identification.....	E-3
Table E.2-1	Analytical methods, method detection limits, and Variable Method Values (VMV codes) for sediment quality variables measured by analytical laboratories for RAMP in 2011.....	E-9
Table F.1-1	Common and scientific names for fish species captured during Fish Populations component activities, 2011.....	F-1
Table F.2-1	External and internal health assessment codes for fish examinations.....	F-2
Table F.2-2	Codes for the location of external fish abnormalities.....	F-5
Table G.1-1	Water Yields to the RAMP lakes, 2002 to 2011 <sup>1</sup> .....	G-2
Table G.1-2	Runoff to the RAMP lakes, 2002 to 2011.....	G-3
Table G.2-1	Comparison of the calculated BC <sub>o</sub> to the current BC <sub>T</sub> in the RAMP lakes.....	G-5
Table G.4-1	Comparison between RAMP lakes in 2011 and 450 regional lakes in the NSMWG database.....	G-8
Table G.5-1	Key chemical characteristics of RAMP lakes having greater than 40% of anion charge attributable to sulphate and chloride.....	G-11
Table G.5-2	Key chemical characteristics of RAMP lakes having greater than 40% of cation charge attributable to sodium and potassium.....	G-12
Table G.6-1	Statistical summary of total trace metals in the RAMP lakes, 2011 to 2011.....	G-14
Table G.6-2	Statistical summary of dissolved trace metals in the RAMP lakes, 2003 to 2011. ....	G-15
Table G.6-3	Mean concentrations of total and dissolved trace metals in the RAMP lakes in each subregion, 2001 to 2011.....	G-16
Table G.6-4	Number of lakes in each region having mean individual trace metal concentrations greater than the 95 <sup>th</sup> percentile.....	G-23
Table G.6-5	List of exceedances of CCME surface water quality guidelines for metals in 2011.....	G-23

## LIST OF FIGURES

Figure A.2-1	Illustration of the SPOT-5 and Landsat-5 scenes acquired, 2011.....	A-2

## **Appendix A**

### **Estimating Area of Land Change for the RAMP Focus Study Area**

---

## **A ESTIMATING AREA OF LAND CHANGE FOR THE RAMP FOCUS STUDY AREA**

### **A.1 INTRODUCTION**

This appendix documents the methodology used to quantify the location, extent, and type of land change in the RAMP Focus Study Area (FSA) as of 2011 related to:

- focal projects (i.e., those projects owned by 2011 RAMP industry members, which were under construction or operational in 2011 in the RAMP FSA); and
- oil sands projects within the RAMP FSA that were under active development in 2011 by companies that were not members of RAMP in 2011.

This land change information was used to designate RAMP sampling stations and locations as *baseline* and *test* and to provide information to the hydrologic analysis of potential effects of focal project activities.

### **A.2 METHODOLOGY**

#### **A.2.1 Satellite Imagery Acquisition**

A total of seven SPOT-5 10-meter resolution scenes were obtained by RAMP (Figure A.2-1); these images were acquired on June 29, June 30, July 4, July 5, July 25, August 8, and August 14, 2011. Two Landsat-5 30 m resolution scenes were also obtained by RAMP; these images (one north and one south of Fort McMurray) were acquired on May 15, 2011 (Figure A.2-1).

#### **A.2.2 Ortho-Rectification of Image Data**

To ensure that the assessments made from the earth observation (EO) imagery were spatially correct, the imagery was first geometrically corrected. The procedure was undertaken using PCI Geomatica® image processing software and entailed the alignment of the image data to a known map projection, essentially georeferencing all pixel values in the data to a known location on the Earth's surface.

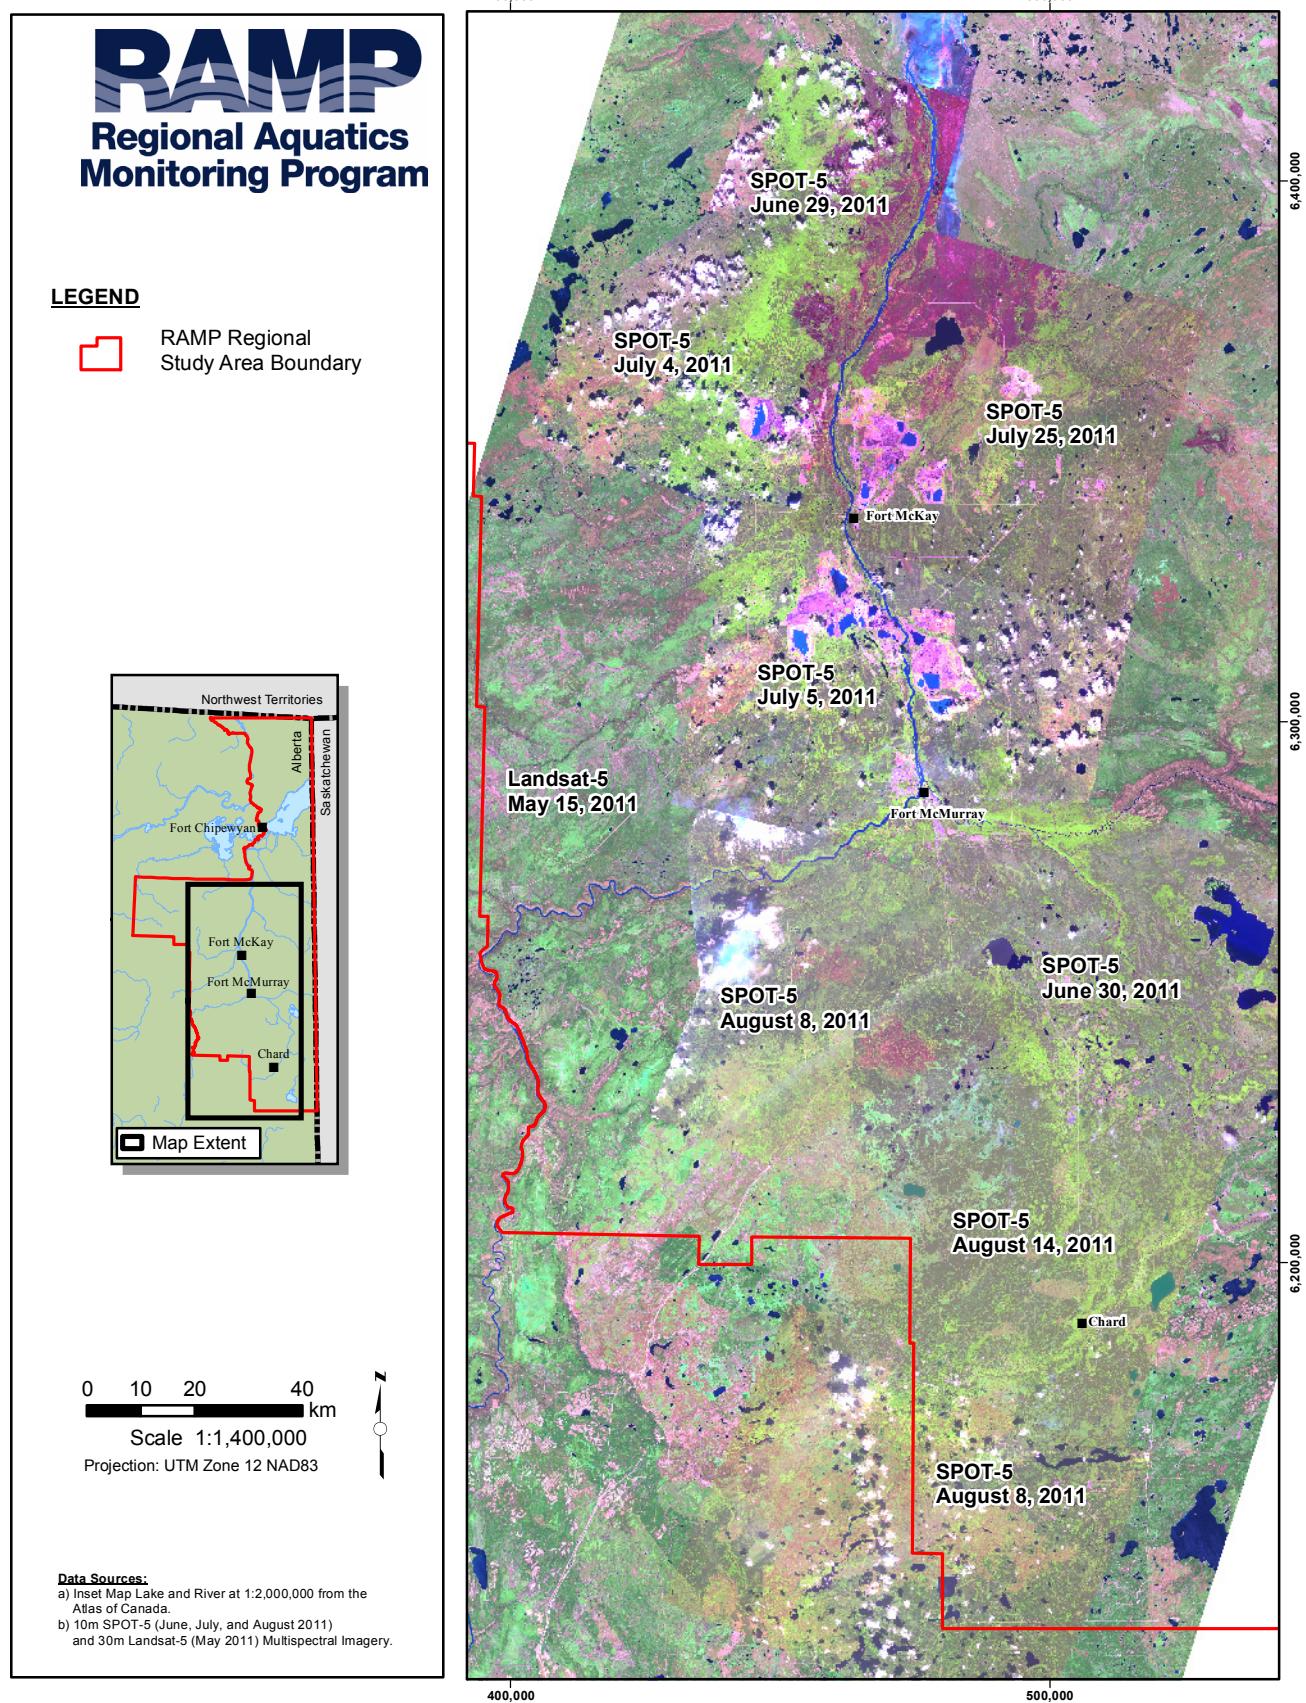

The procedure for ortho-rectifying the image data to a map projection involved the application of previously-collected control points, topographic maps, existing ortho-rectified satellite imagery<sup>1</sup> and a digital elevation model (DEM)<sup>2</sup> to identify common ground control points (GCPs, known reference locations that can be identified on the satellite image). A total of 20 to 30 GCPs for each satellite image were identified to provide enough input values for the image processing software to solve the ortho-rectification algorithm. Once the collection of GCPs was complete, the ortho-rectification model was executed, creating a copy of the image, with the new positions, aligned to the reference maps and the elevation data.

---

<sup>1</sup> Geobase Landsat 7 ETM+ ortho-rectified images from 1999, 2000 and 2001.

<sup>2</sup> Geobase 1:50,000 scale Digital Elevation Model.

**Figure A.2-1 Illustration of the SPOT-5 and Landsat-5 scenes acquired, 2011.**

### A.2.3 Atmospheric Correction

Atmospheric correction<sup>3</sup> was applied to the SPOT-5 and Landsat-5 images using an automated routine within the PCI Geomatica image processing software as well as a spatially-adaptive atmospheric correction model for flat terrain.

### A.2.4 Classification of Land Change

The 2011 areas of land change were digitized beginning with the results of the 2010 classification (RAMP 2011, Appendix A). New land change areas were added and changed areas were modified based on 2010 SPOT-5 and Landsat-5 images, and the digitized polygons were coded to one of two land change classes: closed-circuited; or not closed-circuited. Draft land change maps were then distributed to the RAMP Technical Program Committee in fall 2011 for review and comment, and a final set of land change maps was then prepared.

A GIS overlay analysis was performed to estimate the area of each land change class in each of the RAMP FSA watersheds. The results of the overlay analysis were exported to MS Excel® for data summary.

## A.3 RESULTS

Table A.3-1 and Table A.3-2 provide tabular summaries of the land change in each of the main watersheds by each land change type, for focal projects and non-RAMP oil sands projects within the RAMP FSA. These land change areas are also shown in Figure A.3-1 and Figure A.3-2 for the area north of Fort McMurray and in Figure A.3-3 and Figure A.3-4 for the area south of Fort McMurray.

Land change as of 2011 within the RAMP FSA is estimated at approximately 93,500 ha for focal projects and 700 ha for oil sands projects operated by oil sands companies that were not members of RAMP in 2011, for a total of slightly more than 94,300 ha. This represents approximately 2.7% of the area of the RAMP FSA. The percentage of the area of watersheds with land change as of 2011 varies from less than 1% for many watersheds (MacKay, Ells, Christina, Hangingstone, Horse, and Firebag rivers), to 1% to 5% for the Calumet, Poplar and Steepbank watersheds, to 5% to 10% for the Upper Beaver watershed, to more than 10% for the Muskeg River, Fort Creek, Mills Creek, Tar River, Shipyard Lake, and McLean Creek watersheds, as well as the smaller Athabasca River tributaries from Fort McMurray to the confluence of the Firebag River.

---

<sup>3</sup> Optical satellite imagery captures solar radiation reflected from the earth's surface. As visible light is susceptible to interference created by the presence of water vapor in the atmosphere, it is necessary to correct the imagery to remove these effects.

**Table A.3-1 Area of watersheds with land change as of 2011, summarized by land change type.**

Watershed	Total Watershed Area (ha)	Watershed Area with Land Change (ha)						Watershed Total (ha and %)	
		Focal Projects		Other Oil Sands Projects		Total			
		Not-Closed Circuited (ha)	Closed-Circuited (ha)	Not-Closed Circuited (ha)	Closed-Circuited (ha)	Not-Closed Circuited (ha)	Closed-Circuited (ha)

## **Appendix B**

### **Quality Assurance and Quality Control Procedures for 2011**

---

## **B      QUALITY ASSURANCE AND QUALITY CONTROL PROCEDURES FOR 2011**

### **B.1    QUALITY ASSURANCE PROCEDURES**

Each technical component under RAMP is required to complete a series of procedures to facilitate the collection of a high level of data quality. Environment Canada (2010) defines quality assurance (QA) as:

*Plans or programs that encompass a wide range of internal and external management and technical practices designed to ensure that the collection of data of known quality matches the intended use of the data.*

The following sections present the general procedures used by the RAMP implementation team for all RAMP-related data collection, handling and management. More detailed information regarding quality control for each technical component of RAMP follows the presentation of this general information.

A more detailed explanation of the sampling procedures used by the RAMP implementation team can be found in Appendix A4 of the RAMP Technical Design and Rationale document (RAMP 2009b or [www.ramp-alberta.org](http://www.ramp-alberta.org)).

#### **B.1.1    Field Staff Training**

All personnel participating in 2011 field studies were professional biologists/engineers or technicians with specific training in the subject-matter area in which they were involved. Field crews were assembled based on level of expertise and seniority; although qualifications varied based on level of experience, crews typically included a field crew leader who may be either a B.Sc.- or Master's- level professional and a trained environmental field technician (B.Sc. or Dip. Tech.). All 2011 field-crew members had experience conducting data collection in support of scientifically defensible environmental monitoring programs.

Field crew responsibilities were clearly established prior to beginning fieldwork through the use of Field Work Instructions (FWIs) prepared by the component or task leader. FWIs contained detailed information regarding sampling locations (e.g., coordinate location, access method), appropriate collection methodology, and required supporting variables (e.g., water velocity, field water chemistry). FWIs were prepared and discussed prior to each field sampling trip (typically when the crew was still in the office).

2011 crew members had been trained in field sampling techniques through traditional education (i.e., university or college), work experience and participation in workshops/seminars. In addition, crews had training in Standard First Aid and CPR, as well as any oil sands-specific site training that may have been necessary to access mine sites. In many cases, field personnel have additional training on the Workplace Hazardous Materials Information System (WHMIS), Transportation of Dangerous Goods (TDG) Regulations, Pleasure Craft Operators (as required by the Federal government), swift water rescue, ice safety training, and wilderness first aid.

## B.1.2 Field Operations

### B.1.2.1 Equipment

Sampling gear and equipment used for the RAMP field programs were maintained at the offices of the respective RAMP team members (i.e., Hatfield – Fort McMurray and North Vancouver). Each RAMP component manager (i.e., lead consultant responsible for a RAMP component) controlled specialized field equipment used to complete field studies. Where necessary, routine maintenance was conducted according to manufacturer's instructions to ensure valid data collection.

General field equipment that were used during field surveys (all components) included:

- Provincial sampling permits (e.g., fish collection permits from Alberta Sustainable Resource Development);
- Waterproof paper/data sheets, waterproof labels, indelible markers, pencils, pens, and other stationery (for recording data);
- Topographical maps, hydrographic charts, and/or aerial photos of the oil sands area;
- Garmin 45, 45XL, 12XL or GPSII Global Positioning System (GPS) for obtaining data on sampling station position (latitude and longitude; accurate to approximately ±15 m);
- Digital camera (to record sampling areas, specimens captured, unusual features in the environment, etc.);
- Instruments for measuring the following water quality variables *in situ*: temperature, dissolved oxygen, conductivity, pH, current velocity and depth;
- Miscellaneous equipment: tarpaulin, rope, measuring tape, coolers, plastic buckets, and tool box;
- Waterproof clothing, including rain suits, rubber boots, etc.;
- Floater jackets and/or survival suits, first aid kit and other safety equipment (including boat safety equipment); and
- Publications and previous reports for reference.

Field operations were coordinated through the Hatfield Fort McMurray office. This role included coordination of personnel, sample handling and shipping, and end-of-day safety check-in for field crews.

Information regarding specialized field equipment used for the RAMP program is provided in the following sections and in Appendices C to G for specific components.

### B.1.2.2 Data Collection, Data Tracking and Field Data Sheets

The following general data were typically recorded for field sampling activities conducted for RAMP (with some minor variability among technical components):

- Date and time of sampling;
- Sample numbers;

- Station location (UTM coordinate, datum, zone);
- Initials of field crew members;
- Sampling methods/gear used;
- Number of samples collected (water/sediment/benthos), number of specimens retained/ released/dissected/archived (biota), number of measurements taken (climate and hydrology);
- Volume of sample collected (water/sediment);
- Number of samples in a composite sample;
- Handling techniques, preservation methods, sampling containers used; and
- Photographs of sampling stations.

Field data collection was conducted according to procedures used for all previous RAMP studies (as described in RAMP 2009b).

### **B.1.3 Laboratory Analyses**

Laboratories used to analyze water, sediment and fish tissue samples collected under the RAMP program are required to be accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA). Responsibilities associated with this accreditation include participation in an annual performance evaluation assessment of the laboratory's procedures, methods and internal quality control.

Other samples, such as benthic invertebrate sorting and taxonomy, fish tissue analyses, and fish ageing, are conducted for RAMP by small independent laboratories or boutique consulting companies. These laboratories and companies are required to conduct QA/QC procedures that are considered industry standard for the respective disciplines. For example, QA/QC procedures for benthic invertebrate taxonomy meet or exceed guidelines established by Environment Canada (2010) for environmental effects monitoring (EEM) studies.

### **B.1.4 Data Management**

Field data were entered into Microsoft Excel spreadsheets to facilitate production of tables, figures, etc., for reports. Employees transcribing data into tables checked 100% of the table numbers with the original dataset. Those persons creating graphs checked 100% of the graph numbers with the original dataset.

Information on samples collected (biota/benthos/sediment/water) were carefully recorded on field data sheets, and secured at the end of each field day. All data sheets, field notes, photographs, maps and other supporting documentation were filed within appropriate team members' secure offices. All hard-copy information will be retained for five years after the sampling date.

All products of field sampling (e.g., field notes, analytical results) were checked upon receipt for errors, analytical limits, and reasonable results and, prior to data analysis and reporting, entered data were checked for transcription errors.

Data received from laboratories and measured using field instruments previously entered into a spreadsheet must be checked once they are transposed into a Hatfield

database. A random 10% sample of these data is checked to ensure there is <2% error rate (less than 2 errors for every 100 data points). If the error rate is higher than 2%, the errors are corrected and another random 10% sample of the data is checked.

### B.1.5 Sample Management

All samples were handled (including preservation, storage and shipping) in accordance with established procedures (RAMP 2009b) and with guidelines from respective laboratories. Sample tracking was conducted by field crew leaders (or Fort McMurray-based team members).

Detailed lists of samples shipped to analytical laboratories were made, such that samples could be tracked from point of shipment to the laboratory (water/sediment/benthic taxonomy). Chain of Custody (COC) forms (commonly issued by the receiving laboratory) were used to notify receiving laboratories of the number and type of samples that were being shipped. Data provided on this sheet included date, project, sample type (fish, sediment, water, benthic invertebrates, etc.), sampling location, sender's name, and any preservation added/required. Sample numbers of all specimens/containers collected, corresponding to field sample numbers, were listed. A description of each sample shipped was provided (i.e., station number, sediment, date and time collected, analyses to be performed). The receiver was required to check the shipping list to ensure all samples were accounted for and in good condition, and confirm (via fax and/or e-mail) samples received, date, and analyses to be performed. To facilitate this process, a standard RAMP COC form was used by the Hatfield team, which simplified the management of sample processing and analysis.

### B.1.6 RAMP Quality Assurance Plan

In 2002, a formal RAMP-specific Quality Assurance Plan (QAP) was developed and implemented to cover all routine QA-related activities for the project. These methods were used in 2011 by the Hatfield RAMP team to ensure consistency of methods among years. Activities covered in the RAMP QAP include:

- Pre-field meetings to discuss field methods (i.e., FWIs) and specifics of field tasks;
- Post-field meetings to discuss results of the field activities and identify areas for improvement in future;
- Routine check-in with component leaders (24 or 48-hour interval) or the RAMP project manager during field work, as required;
- Designation of a staff member for each component/trip (i.e., water quality, fall field trip) to track sample handling, labeling (including COC forms), shipping and to confirm timely receipt of samples by the analytical laboratory;
- Internal check of COC forms by component leaders upon the return of the field crew (to confirm analyses requested were correct);
- Internal check of data upon receipt from external laboratories; and
- Internal check of entered field data for transcription errors.

## **B.2 QUALITY CONTROL PROCEDURES**

Quality control (QC) is a component of QA that pertains to internal techniques used to measure and assess data quality (APHA 2000, in RAMP 2009b). QC activities for each RAMP technical component used in 2011 are described below.

### **B.2.1 Climate and Hydrology Component**

#### **B.2.1.1 Quality Control Activities – Field**

Climatic and hydrologic data collection and processing were subject to the following quality control field procedures to ensure that the published data were as accurate as possible:

- Stream discharge measurements and water level surveys were performed in accordance with standard procedures. Each discharge measurement was qualified according to the criteria presented in the standard operating procedures in RAMP (2009b), based on observations of station conditions and analysis of the collected data;
- Sensors at climatic and hydrologic monitoring stations were calibrated on a regular basis. Sensors at climatic stations have been rotated with spare units on a two-year frequency and the units retrieved from the field were recalibrated by the manufacturer. Calibration curves for pressure transducers were verified prior to installation. Consistency between water level surveys and pressure transducer readings was checked during every field visit for all stations. Pressure transducers were exchanged with calibrated sensors after being installed for two years at year-round stations unless a deviation from surveyed water levels was observed at which time sensors were exchanged prior to the standard two-year service;
- Manual discharge measurements and concurrent water levels were compared on a plot of stage versus discharge, to check for consistency between measurements and consistency with previously established stage-discharge relationships. Rating curve shifts due to changes in channel geometry, beaver dams and obstructions or roughness changes were accounted for by revision of stage-discharge rating curves or application of backwater shift corrections; and
- Snow course surveys were performed according to standard protocols as presented in RAMP (2009b).

#### **B.2.1.2 Quality Control Activities – Office**

Climatic and hydrologic data collection and processing were subject to the following quality control office procedures to ensure that the published data were as accurate as possible:

- Apparent transducer elevations were calculated after each field visit as the difference between the surveyed water surface elevation and the sensor reading. The history of apparent transducer elevations was plotted for each station to check for physical sensor movement or calibration drift. Continuous water levels measured by the transducer were subsequently converted to elevations, adjusting for movement or drift.

- Rainfall, snowfall, air temperature, humidity, and wind speed data from automated climate sensors were compared to other local and regional records as well as manual observations recorded during site visits.
- All discharge measurements and station visit records were prepared by one person and checked by another.
- Velocity distributions at measurement cross sections were plotted and reviewed to ensure reasonable variation in velocity with flow depth and bed roughness.
- Hydrographs computed from continuous water level measurements and the stage-discharge rating curve were compared with manual measurements on the same plot. The resulting hydrographs were reviewed for consistency.
- Anomalies in the hydrographs, such as rapid changes in water level or discharge, were examined in detail to confirm authenticity. In cases where the data were inconsistent with other local and regional data (for instance, an isolated high water reading, without a subsequent recession curve), they were interpreted or discarded.
- Hydrographs computed for different stations in the same region were compared to identify anomalies and verify similarity in the timing and magnitude of runoff responses. Hydrographs were also analyzed to ensure anticipated effects such as time lag, attenuation by river or lake routing and increments in discharge with drainage area were apparent in the records.

## B.2.2 Water Quality Component

### B.2.2.1 Methods

#### ***Field Collections***

The following precautions were used in the field to prevent sample contamination:

- All sample bottles used were provided to the RAMP sampling team as “certified clean” by the laboratories (ultra-trace mercury bottles were pre-filled using specific procedures stipulated by AITF);
- Grab samples were collected upstream of the boat and/or the person collecting the sample to avoid disturbing the substrate or otherwise contaminating the sample;
- Powder-free latex or nitrile gloves were worn during sample collection;
- Sample containers were kept covered during collection of composite samples;
- Winter samples were collected from approximately 20 cm below the ice where possible to minimize potential contamination from auger disturbance, using a peristaltic pump with fresh tubing at each station; and
- Samples for analysis of dissolved metals were filtered in the laboratory instead of in the field, following laboratory direction.

Potential contamination of samples during collection, handling, and transport was assessed using field blanks and trip blanks. Field blanks were used to assess potential contamination from sample handling, and were prepared in the field by filling sample bottles with deionized water provided by the laboratory. Trip blanks were prepared in

the analytical laboratory prior to sampling and kept sealed for the duration of the sampling trip; these were used to evaluate potential contamination from the sample container and the efficacy of storage conditions. Field blanks and trip blanks were utilized in all four seasons of sampling, and were analyzed for the same variables as RAMP samples. Field and trip blanks were labeled with dummy RAMP-style codes (i.e., BAR-1, DAR-1) to ensure “blind” laboratory analysis.

Field and trip blank analytical results were compared to analytical detection limits. Analyte concentrations greater than five times the detection limit in the blank samples may demonstrate potential contamination of samples during sample collection or analysis or analytical error. Blanks with analyte concentrations below or near detection limits represent samples that were collected, handled, and analyzed without contamination or potential errors.

Duplicate samples were collected from the Athabasca River, east bank downstream of all developments (ATR-DD-E, winter), Athabasca River, east bank upstream of Donald Creek (ATR-DC-E, summer), upper Beaver River (BER-2, fall), and upper MacKay River upstream of Suncor MacKay developments (MAR-2, fall). Duplicate samples were taken to assess environmental heterogeneity and laboratory precision. Analytical results for duplicate samples were compared, and the relative percent difference (RPD, difference between data values / average of data values, multiplied by 100%) was calculated for each analyte. Relative percent differences greater than 20% were noted as potentially unacceptable levels of precision. However, because precision decreases as the analyte concentration approaches the detection limits, relative percent differences greater than 20% were considered to be of significance only if analyte concentrations in both samples were greater than five times the detection limit. This target 20% RPD between duplicates is identical to QA thresholds used internal by contracted laboratories for most variables measured, although acceptable internal laboratory RPDs for some organic compounds (e.g., CCME hydrocarbons, some PAHs, etc.) may be higher (e.g., 30 or 40%).

### **Sample Analysis**

Chemical laboratories analyzed a number of their own QA/QC samples to ensure that sample contamination did not occur during analysis and that results reported were precise and accurate. A method blank, consisting of a de-ionized water sample prepared at the initiation of the analysis, was used to assess potential contamination during analyses. A sample split into two aliquots (split sample, also called a laboratory duplicate) was used to assess the precision of the analyses. Spiked samples, reference standards, and other controls were used by the analytical laboratories to establish the accuracy and precision of the analyses.

All laboratory QA/QC samples were assessed using in-house laboratory protocols to identify potential contamination and determine the precision and accuracy of the analyses, where these data were provided with analytical results (all laboratories used by RAMP for water and sediment-quality analyses reported internal QA/QC results except AITF). Any deviations from QA/QC criteria were identified in the laboratory reports and are noted in the results section that follows.

Any anomalous values identified in laboratory reports were followed up with the laboratory to determine if the value was a measurable value or due to a transcription or analytical error.

## B.2.2.2 Results and Discussion

### ***Field and Trip Blanks***

Field blanks were completed during winter, summer, and fall sampling seasons – one field blank was filled in winter and summer, and two field blanks were filled in fall. Concentrations of all conventional variables, major ions, nutrients, hydrocarbons, dissolved and total metals and polycyclic aromatic hydrocarbons (PAHs) in field blanks were less than five times the detection limit in 2011 (Table B.2-1), with the exception of total phenols, C4 phenanthrenes/anthracenes, C4 naphthalenes, and flourene in summer. All conventional variables, major ions, nutrients, and hydrocarbons were below analytical detection limits in the field blank sample collected on September 15, 2011; total metals, dissolved metals, naphthenic acids, and oil sands acid extractable were measured at levels consistent with ambient water quality samples. These results were identified as a laboratory error and were excluded from analysis.

Trip blanks were completed during winter, spring, summer, and fall sampling seasons – one trip blank was filled in the winter, spring and summer, and two trip blanks were filled in fall. Concentrations of all conventional variables, major ions, nutrients, hydrocarbons, dissolved and total metals and PAHs in trip blanks were less than five times the detection limits (Table B.2-2) with the exception of total phenols (summer). An investigation was initiated by the laboratory to identify possible sources of total phenols contamination in both the trip and field blank during summer sampling. No sources were identified, but the contamination was not expected to affect other summer water quality samples.

### ***Duplicate Samples***

Duplicate samples were taken at four stations in 2011: ATR-DD-E in winter, ATR-DC-E in summer, and BER-2 and MAR-2 in fall. Conventional variables, major ions, nutrients, and hydrocarbon concentrations were generally quite similar in the duplicate samples. The RPD for all conventional variables, major ions, nutrients, and hydrocarbons was less than 20% for those analytes where concentrations in both samples were greater than five times the detection limit (Table B.2-3 to Table B.2-6), with the exception of AITF naphthenic acids at ATR-DD-E (winter) and MAR-2 (fall); dissolved phosphorus at ATR-DC-E (summer) and BER-2 (fall); total phenols at ATR-DC-E (summer) and total dissolved solids, total phosphorus, and AITF oil sands acid-extractables at BER-2 (fall).

The RPD for most analytes was less than 20% for those analytes where concentrations in one or both samples were less than five times the detection limit (Table B.2-3 to Table B.2-6) with the exception of total suspended solids at both ATR-DD-E (winter) and BER-2 (fall), sulphide at ATR-DC-E (summer) and sulphide and total Kjeldahl nitrogen at BER-2 (fall).

The number of metals concentrations with RPD >20% in duplicate samples varied among stations, suggesting that different rivers exhibited varying degrees of environmental heterogeneity. The RPD was less than 20% for all analytes where one or both samples were greater than five times the detection limit with the following exceptions:

- ATR-DD-E (winter): dissolved copper, titanium and zinc, and total copper;
- ATR-DC-E (summer): dissolved manganese and mercury, total lithium and ultra-trace mercury, and most PAHs;

- MAR-2 (fall): dissolved copper, and total aluminum, copper and titanium; and
- BER-2 (fall): dissolved copper and lead, and dissolved titanium and zinc.

The RPD was less than 20% for all analytes where one or both samples were less than five times the detection limit with the following exceptions:

- ATR-DD-E (winter): dissolved nickel, and ultra-trace mercury;
- ATR-DC-E (summer): dissolved chromium, dissolved lead, and total silver; and
- BER-2 (fall): dissolved chromium, dissolved zinc, and ultra-trace mercury.

The RPD of most PAHs in duplicate samples was high in the summer sample from ATR-DC-E, but in fall were below 20% for all PAHs in duplicate samples at MAR-2 and BER-2 (where only retene exceeded) (Table B.2-4, Table B.2-5). The high variability of PAH values between duplicates in summer versus fall may be related to the high suspended solids in the summer samples (i.e., nearly 500 mg/L), versus fall (i.e., <3 mg/L for MAR-2 and less than 15 mg/L for BER-2); given most waterborne PAHs are likely associated with particulate matter (see Section 5), the large amount of particulate matter in the summer ATR-DC-E sample may have contributed to high variability in concentrations of individual PAHs.

### B.2.2.3 Conclusions and Recommendations

Results from the QA/QC evaluation of water quality data indicated that overall, data collected for the water quality component was of high quality. The results of trip and field blank analyses suggested that laboratory-generated concentrations were reliable. The analysis of duplicate samples indicated some variability within stations, likely related to local-scale heterogeneity among samples.

**Table B.2-1 Results of analysis of field blanks prepared during RAMP water quality surveys in winter, spring, summer and fall, 2011.**

<sup>1</sup> Relative percent difference (RPD) = (difference between sample 1 and 2)/(average of sample 1 and 2) x 100%. RPD for undetectable analytes (i.e., < detection limit) was calculated assuming a concentration equal to the detection limit.

Precision is influenced by how close the analytical value is to the method detection limit. Thus, assessing percent mean differences is valid only for analytical values that are at least five times the detection limit.

# Analytes differ by > 20% between duplicates but 1 or both concentrations are < 5 times the detection limit.

# Analytes differ by > 20% between duplicates and concentrations are > 5 times the detection limit.

<sup>1</sup> Relative percent difference (RPD) = (difference between sample 1 and 2)/(average of sample 1 and 2) x 100%. RPD for undetectable analytes (i.e., < detection limit) was calculated assuming a concentration equal to the detection limit.

Precision is influenced by how close the analytical value is to the method detection limit. Thus, assessing percent mean differences is valid only for analytical values that are at least five times the detection limit.

# Analytes differ by > 20% between duplicates but 1 or both concentrations are < 5 times the detection limit.

# Analytes differ by > 20% between duplicates and concentrations are > 5 times the detection limit.

<sup>1</sup> Relative percent difference (RPD) = (difference between sample 1 and 2)/(average of sample 1 and 2) x 100%. RPD for undetectable analytes (i.e., < detection limit) was calculated assuming a concentration equal to the detection limit.

Precision is influenced by how close the analytical value is to the method detection limit. Thus, assessing percent mean differences is valid only for analytical values that are at least five times the detection limit.

# Analytes differ by > 20% between duplicates but 1 or both concentrations are < 5 times the detection limit.

# Analytes differ by > 20% between duplicates and concentrations are > 5 times the detection limit.

## **B.2.3 Benthic Invertebrate Communities Component**

### **B.2.3.1 Quality Control Activities – Field**

Field methods used for benthic invertebrate collection are considered to follow accepted methods for environmental effects monitoring (Anderson 1990, Environment Canada, 2010). Instruments used for measuring supporting variables (e.g., temperature, dissolved oxygen, conductivity, pH, current velocity and depth) were calibrated according to manufacturer instructions (generally daily for water quality meters).

### **B.2.3.2 Quality Control Activities – Laboratory**

Taxonomic samples were sorted and identified by Dr. Jack Zloty of Summerland, BC, who has analyzed benthic invertebrate samples on behalf of RAMP consistently since the program began. Laboratory methods used by Dr. Zloty in 2011 included resorting of 5% of samples as a confirmation of the overall sorting efficiency of all samples. In 2011, a total of 14 samples were re-sorted. Sorted portions were verified by an independent analyst. As a result of large volumes of organic material and low abundance in some samples collected from depositional sites, a minimum removal efficiency of 90% was considered acceptable (as for previous RAMP studies). This objective is considered acceptable by Environment Canada under current Environmental Effects Monitoring (EEM) strategies (Environment Canada 2010).

Data were received in electronic format (Microsoft Excel) from the taxonomist. All data were checked upon data entry for transcription errors or other inconsistencies. Data analysis was conducted iteratively, using duplicate data files for processing. Original data were retained in back-up files for the project. Printed output from statistical analyses was retained in project files in the event that analyses may be reviewed and reproduced if needed.

### **B.2.3.3 Quality Control Activities – Results**

Results for quality control samples (5% re-sorts) from the 2011 RAMP benthic invertebrate community component indicated that this objective was consistently achieved (Table B.2-7).

Invertebrate sorting efficiency was always greater than 96%, with an average of 98.6%. Based on the criterion of 90% sorting efficiency, these results were considered acceptable and additional QC activities were not required.

$$\text{sorting efficiency} = \left( 1 - \frac{A}{A + B} \right) * 100,$$

where,

A is the number of animals found in the re-sorted sample; and

B is the number of animals found in the original sorting of that sample.

**Table B.2-7 Results of quality control checks on sorting efficiency of RAMP benthic invertebrate samples, 2011.**

Reach	% Sorting Efficiency
MCL-1 #3	[1-(16/(1026+16))]*100 = <b>98.5</b>
ISL-1 #1	[1-(4/(366+4))]*100 = <b>98.9</b>
BPC-1 #5	[1-(4/(249+4))]*100 = <b>98.4</b>
FLC-1 #5	[1-(0/(3+0))]*100 = <b>100</b>
TAR-E2 #1	[1-(3/(127+3))]*100 = <b>97.5</b>
JAC-D2 #5	[1-(5/(238+5))]*100 = <b>97.9</b>
CLR-D2 #2	[1-(1/(147+1))]*100 = <b>99.3</b>
TAR-D1 #5	[1-(0/(10+0))]*100 = <b>100</b>
MAR-E2 #5	[1-(13/(922+13))]*100 = <b>98.6</b>
ELR-D1 #3	[1-(4/(463+4))]*100 = <b>99.1</b>
BER-D2 #1	[1-(12/(504+12))]*100 = <b>97.7</b>
HHR-E1 #5	[1-(15/(694+15))]*100 = <b>97.9</b>
ELR-E2A #3	[1-(6/(271+6))]*100 = <b>97.8</b>
MAR-E3 #4	[1-(4/(386+4))]*100 = <b>99.0</b>

Note: Average efficiency – 98.6%; 14 samples - ~5% of all samples.

## B.2.4 Sediment Quality Component

The 2011 RAMP sediment quality QA/QC program was conducted to assess potential sample contamination during collection and analysis, the precision and accuracy of the chemical and toxicological analyses, and environmental heterogeneity.

### B.2.4.1 Methods

The following field procedures were used to prevent sample contamination:

- Sampling equipment was washed with metal-free soap and rinsed with ambient site water, rinsed with hexane and then acetone, and triple-rinsed with ambient water prior to sample collection at a given station;
- Sample grabs were kept only if they contained no large foreign objects, obtained adequate sediment penetration depth, and were not overfilled or leaking; and
- Staff wore powder-free latex gloves during equipment washing and sampling.

Split samples (in which a single, large sample was subsampled) and duplicate samples (in which two unique samples were taken from the same location) were collected from Muskeg River (MUR-D3) and the Ells River (ELR-D1).

Duplicate samples were taken to assess environmental heterogeneity. The relative percent difference (RPD) in the results obtained for the split and duplicate samples was calculated. Analytes for which the relative percent difference between duplicate / split sample and the site sample exceeded 20% (with concentrations greater than five times the detection limit in both samples) were considered to exhibit potentially unacceptable levels of imprecision.

In addition, two sampling-equipment rinsate blanks were collected in fall 2011. Sampling equipment (i.e., Ekman dredge, stainless-steel tray, and spoons) were washed with Liquinox soap, ambient water, hexane, acetone, and deionized water, as per the standard operating procedure at sampling locations; rinsate samples were collected by washing down the dredge with deionized water, which was collected into the tray (containing spoons) and decanted into a sample analysis bottle. The rinsate was analyzed for PAHs (at ng/L) by AXYS Analytical Services (the same laboratory that analyzed PAHs in sediments); and for metals (at mg/L) by AITF in Edmonton. Concentrations of metals in sediments were compared against 5 times their analytical detection limit and PAHs were assessed against 5 times the laboratory blank concentration, to assess potential sample contamination related to equipment.

#### B.2.4.2 Results and Discussion

##### ***Duplicate Samples***

Concentrations of several metals and PAHs differed by over 20% between duplicate samples collected at stations MUR-D3 and ELR-D1 (Table B.2-8 and Table B.2-9). These results suggested high within-location variability in metal and PAH concentrations, which has been observed historically, in both laboratory-generated and field-collected duplicates.

##### ***Split Samples***

Several variables in the split samples at stations MUR-D3 and ELR-D1 differed by greater than 20% from the sample (Table B.2-8 and Table B.2-9); there was more variation in split samples analyzed for PAHs than for samples analyzed for metals. These results are consistent with split-sample analyses undertaken in previous years of RAMP, suggesting that although concentrations of metals are generally consistent within the sediment matrix in a given sample, PAHs were unevenly distributed in sediments, or within a single sample.

##### ***Rinsate Samples***

Several dissolved metals were detected at concentrations greater than five times the analytical detection limit in the rinsate sample collected at station ELR-D1 (Table B.2-10), including dissolved aluminum, barium, copper, iron, manganese, strontium, tin, titanium, and zinc. No dissolved metals were found to exceed five times the detection limit in the rinsate sample collected at station MUR-D3, and no total metals were found to exceed concentrations of five times the detection limit in either rinsate sample (Table B.2-10). Several PAHs were also detected at concentrations greater than five times the analytical detection limit in both rinsate samples in fall 2011 (Table B.2-11); most of these were detected in the rinsate collected from station ELR-D1. The majority of PAHs measured above ( $>5x$ ) detection limits in both rinsates were lighter, more soluble species, such as parent and alkylated naphthalenes and biphenyl, as well as phenanthrenes. These results for PAHs were consistent with previous years' rinsate samples.

### B.2.4.3 Conclusions and Recommendations

Results of QA/QC samples collected for sediments by the RAMP program in 2011 were consistent with those collected in previous years of the RAMP program. These samples generally indicate high variability of PAHs in sediments within a sampling location and that spatial variation can occur on a scale smaller than the Ekman dredge. Concentrations of metals are generally more consistent within samples and within locations, although some variability between samples from a given station may occur.

Some metals and PAHs were present at low concentrations in rinsate blanks, which may suggest insufficient rinsing of sampling equipment with deionized water to remove all traces of ambient (creek) waters prior to decanting of deionized waters for rinsate analysis, and/or insufficient scrubbing or solvent use in advance of sampling to remove attached all particulates from sampler/tray surfaces. Most traces of metals and PAHs were detected in the rinsate sample collected from station ELR-D1. Concentrations were generally very low relative to concentrations measured in sediment (e.g., for PAHs, parts per trillion in rinsate versus parts per million in sediment); therefore, these concentrations in rinsate would not likely substantially affect measured concentrations in sediment. However, clean technique remains critical in sampling of sediments, particularly for strongly hydrophobic variables like many PAHs.

\* Values shown for the detection limit are concentrations found in the lab blank.

Indicates the sample concentration was greater than five times the concentration in the lab blank.

## B.2.5 Fish Populations Component

### B.2.5.1 Quality Control Activities – Field

Fish and fish habitat field activities were conducted in accordance with field methods considered to be standard scientific practice (e.g., Environment Canada 2010) and methods used in previous RAMP studies (RAMP 2009b). Prior to every field program, fieldwork instructions (FWIs) were prepared by the Component Manager. These FWIs provided technical detail on all field data collection activities planned for the program and were reviewed by all members of the field crew prior to starting the field program.

All field personnel were trained in the proper use of all field equipment to ensure accurate and safe data collection. Instruments used for measuring supporting field water quality variables (e.g., temperature, dissolved oxygen, conductivity, pH, current velocity and depth) were calibrated according to recommendations from the respective manufacturer (as frequently as daily for pH and dissolved oxygen meters). Station locations were recorded using a GPS unit. All sampling details (e.g., date, time, methods used, personnel, measurements) were recorded on project-specific field data sheets and/or in waterproof field books. Upon completion of the fieldwork, all datasheets and field books were stored in a fireproof cabinet in the Hatfield office.

Sample shipping (e.g., for fish tissues sent to Flett Research Ltd. and ALS Environmental Ltd.) was conducted using CoC forms provided by the laboratory.

### B.2.5.2 Quality Control Activities – Laboratory

#### *Fish Tissue*

Results of fish tissue analyses by Flett Research Ltd. (Flett) included a description of QC techniques used. If relevant, comments on the results of the analyses were indicated on the printed results received from the laboratory. QC results met acceptable guidelines for the laboratory's own internal quality procedures (a condition of membership in the Canadian Association for Environmental Analytical Laboratories [CAEAL]). In the event alternate procedures were required to achieve a result, this information was also detailed on the laboratory output. QC procedures used by Flett included laboratory duplicates, spike samples, calibration control, use of certified reference standards and internal standards. Duplicate samples for mercury analyses were completed for fifty-five individual tissue samples (Table B.2-12).

Data were received in electronic format (Microsoft Excel<sup>©</sup>) from the analytical laboratory or entered by hand for other field programs. All data were checked upon data entry for transcription errors or other inconsistencies. Analysis of collected data was done using an iterative approach, using duplicate data files for processing. Original data were retained in back-up files for the project. Where used, printed output from statistical analyses was retained in project files in the event that analyses may be reviewed and reproduced if needed.

Laboratory duplicate samples exhibited low variability between the original sample and the duplicate samples. The relative percent difference was less than 20% for all samples where QA/QC analyses were performed, indicating consistent laboratory procedures for analyzing mercury in fish tissue.

**Table B.2-12 Relative percent difference between duplicate mercury fish tissue samples collected from the Athabasca River, fall 2011.**

Waterbody	Sample ID	Units	Sample Date	Sample	Duplicate	Relative Percent Difference	Type of Sample
<b>Athabasca River</b>	WALL-36-5B	ng/g wet weight	22-Sept-11	806	724	11.3	Duplicate
	LKWH-13-11A	ng/g wet weight	22-Sept-11	61.4	61.8	-0.6	Duplicate
	WALL-15-5B	ng/g wet weight	22-Sept-11	324	316	2.5	Duplicate

### **Fish Ageing**

Results of fish ageing analyses by North/South Consultants included a description of QC techniques used. All ageing structures were viewed (read) a minimum of two times. If consistency was met within the two reads the final age was assigned, if consistency was not met the structure was read a third time. If consistency was not accomplished within three reads the structure was deemed un-ageable and no age was assigned. All readings were conducted as “blind” (independent from each other). Quality control and quality assurance was then conducted by an alternate ageing technician on at least 10% of randomly selected structures (unless readings one and two were conducted by different technicians, in which case the quality control and quality assurance was already completed). The QA/QC readings were also conducted “blind” to determine consistency and accuracy.

Data were received in electronic format (Microsoft Excel<sup>®</sup>) from the analytical laboratory. All data were checked upon data entry for transcription errors or other inconsistencies. Analysis of collected data was done using an iterative approach, using duplicate data files for processing. Original data were retained in back-up files for the project. Where used, printed output from statistical analyses was retained in project files in the event that analyses may be reviewed and reproduced if needed.

Laboratory readings of the ageing structures exhibited low variability between the two reads. The relative percent difference was less than 20% for all structures where QA/QC analyses were performed (205 structures), indicating consistent laboratory procedures for analyzing ages in fin ray samples.

## B.2.6 Acid-Sensitive Lakes Component

Field sampling under the Acid-Sensitive Lakes Component of RAMP is conducted entirely by personnel from Alberta Environment and Water. Water samples collected at each lake were analyzed by the University of Alberta Limnology Laboratory. The laboratory uses a series of set procedures, outlined in detail below, for analytical quality control; the procedures used are identical to those used in previous RAMP studies (e.g., RAMP 2010).

### B.2.6.1 Quality Control Activities – Field

Water sample collection in the field utilized standard practices for quality control of samples to avoid contamination. Field instruments (e.g., water quality meters) were cared for so as to maximize data quality (i.e., proper calibration according to manufacturer specifications). Procedures used included the following:

- Collection of samples away from the influence of the boat or float plane (i.e., to minimize chance of sample contamination from fuel that may be in the water);
- All sampling equipment was thoroughly cleaned between lakes;
- Sample containers were tripled-rinsed prior to filling (cap included);
- Sample containers were filled to the top (i.e., no head space);
- Samples were stored under cool (4°C) conditions and in the dark (i.e., in a refrigerator); and
- Samples were submitted to the appropriate analytical laboratory within established maximum holding period (typically 48 hours).

Duplicate samples were collected during the ASL component sampling program, which accounted for 6% of the total number of samples collected. Variability between duplicate samples was assessed as high when the relative percent difference between sample concentrations for an analyte was greater than 20% when both concentrations were greater than or equal to five times the MDL.

### B.2.6.2 Quality Control Activities – Laboratory

The University of Alberta Limnology Laboratory maintains an internal QA/QC program to maximize the quality of analytical results. The laboratory QA/QC program includes use of standard reference samples and periodic comparison samples (i.e., blanks) sent to other laboratories. The laboratory prepares standard QC samples for each group of analytes from analytical grade chemicals or standard reference samples. In the event that QC objectives are not achieved, corrective actions are initiated to determine the cause.

Annually, ten samples of known chemistry are submitted by Environment Canada's National Water Research Institute (NWRI) for blind analysis and comparison. Two times per year, quality control samples are sent to the University of Alberta Limnology Laboratory by the Norwegian Institute for Water Research for analysis and comparison.

In all cases, analytical samples are run along with standard laboratory reference samples to create a standard results curve. QC solutions are then run in duplicate. If results for the QC samples are consistent for a series of analyses, no additional QC testing is required. If results from QC samples are divergent from the standards, corrective action is initiated to

determine the cause and results that may be affected. When new QC samples are prepared, each one is tested against the previous QC samples (for a given variable) to assess comparability.

### **B.2.6.3 Results and Discussion**

#### ***Duplicate Field Samples***

Duplicate samples were taken in three of the 50 lakes for conventional variables, ions, and nutrients (Table B.2-13). All of the analytes were compliant with the criteria stated above with the exception of sodium in Lake SM5 and chloride in Lake NE11.

#### ***Laboratory Quality Control Results***

The results from the analysis of the University of Alberta Laboratory reference standards are presented in Table B.2-14. The table provides the measured and theoretical concentrations of each QC standard as well as the percent bias (discrepancy). An allowable bias of 10% was applied and all analytes were within this criterion.

**Table B.2-13 Relative percent difference between duplicate water quality samples collected for conventional variables from three RAMP lakes sampled in 2011.**

Analyte	Unit	Detection Limit	SM5 29-Aug-11	Duplicate 29-Aug-11	Relative Percent Difference (%) <sup>1</sup>	WF4 17-Aug-11	Duplicate 17-Aug-11	Relative Percent Difference (%)	NE11 1-Sep-11	Duplicate 1-Sep-11	Relative Percent Difference (%)

Chlorophyll	µg/L	0.02	7.83	8.00	-2.1	74.9	74.4	0.7	11.52	11.93	-3.5

Note: <LOD = less than detection limit

<sup>1</sup> Relative percent difference (RPD) = (difference between sample 1 and 2)/(average of sample 1 and 2) x 100%. Precision is influenced by how close the analytical value is to the method detection limit. Thus, assessing percent mean differences is valid only for analytical values that are at least five times the detection limit.

## **Appendix C**

### **Climate and Hydrology Component**

---

## C CLIMATE AND HYDROLOGY COMPONENT

This appendix summarizes the data collected for the RAMP Climate and Hydrology component in the 2011 water year (WY). The 2011 WY was defined as the period from November 1, 2010 to October 31, 2011. The appendix presents descriptions of the climate and hydrometric stations used to collect these data, along with other station-related information.

### C.1 2011 CLIMATE AND HYDROLOGY STATIONS

A list of the climate and hydrometric stations is provided in Table C.1-1.

**Table C.1-1 RAMP climate, hydrometric and snowcourse stations monitored in 2011.**

RAMP Station	Name	UTM Coordinates <sup>1</sup>		Operating Season	Variables Measured
		Easting	Northing		
C1	Aurora Climate Station	475229	6344053	all year	air temperature, total precipitation, humidity, solar radiation, snow on the ground, wind speed and direction
C2	Horizon Climate Station	443364	6360510	all year	air temperature, total precipitation, humidity, solar radiation, snow on the ground, barometric pressure, wind speed and direction
C3	Steepbank Climate Station	473950	6320500	all year	air temperature, total precipitation, humidity, solar radiation, snow on the ground, barometric pressure, wind speed and direction
C4	Pierre Climate Station	460898	6378737	all year <sup>3</sup>	air temperature, total precipitation, humidity, solar radiation, snow on the ground, barometric pressure, wind speed and direction
C5	Surmont Climate Station	502542	6230964	all year <sup>4</sup>	air temperature, total precipitation, humidity, solar radiation, snow on the ground, barometric pressure, wind speed and direction
L1	McClelland Lake	483398	6372186	all year	water level, total precipitation, humidity, air temperature, water temperature
L2	Kearl Lake	484815	6351080	all year	water level, total precipitation, humidity, air temperature, water temperature
L3	Isadore's Lake	463297	6342981	all year	water level
S2	Jackpine Creek at Canterra Road	474971	6344091	all year	level, discharge, water temperature
S3	Iyinimin Creek above Kearl Lake	489423	6345196	open-water	level, discharge, rainfall
S5	Muskeg River above Stanley Creek	479761	6356759	all year	level, discharge, water temperature
S5A	Muskeg River above Muskeg Creek	476042	6351803	all year	level, discharge, barometric pressure, water temperature
S6	Mills Creek at Highway 63	463755	6344927	all year	level, discharge, water temperature
S7	Muskeg River near Fort McKay (07DA008)	465552	6338804	Winter <sup>2</sup>	level, discharge, water temperature
S9	Kearl Lake Outlet	483983	6347020	all year	level, discharge, water temperature
S10	Wapasu Creek at Canterra Road	490276	6355968	all year	level, discharge, water temperature
S11	Poplar Creek at Highway 63 (07DA007)	471972	6307825	all year	level, discharge, water temperature
S12	Fort Creek at Highway 63	462620	6363554	open-water	level, discharge
S14A	Ells River at the Canadian Natural Bridge	455738	6344944	all year	level, discharge, water temperature

<sup>1</sup> UTM coordinate datum is NAD83 Zone 12V. In 2011, a differential GPS was used to increase the accuracy of UTM coordinates. Changes from previous coordinates reflects this increased accuracy and does not reflect a change in physical station location. Coordinates for WSC stations were based on WSC values posted for the stations (<http://www.wateroffice.ec.gc.ca>).

<sup>2</sup> WSC monitors water level and discharge at these stations during the open-water season.

<sup>3</sup> C4 Pierre Climate Station began operation in July 2011.

<sup>4</sup> C5 Pierre Climate Station began operation in October 2011.

<sup>5</sup> S16A replaced CR-1 (CNRL) and former RAMP S16 which all monitor the Calumet River near the mouth.

<sup>6</sup> Station began operation in August 2011.

<sup>7</sup> Station began operation in May 2011.

**Table C.1-1 (Cont'd.)**

RAMP Station	Name	UTM Coordinates <sup>1</sup>		Operating Season	Variables Measured
S15A	Tar River near the mouth	458458	6353439	open-water	level, discharge, water temperature
S16A	Calumet River near the mouth	458096	6362020	open-water <sup>5</sup>	level, discharge
S19	Tar River Lowland Tributary near the mouth	457326	6352850	open-water	level, discharge, rainfall
S20	Muskeg River Upland	492107	6355709	open-water	level, discharge
S22	Muskeg Creek near the mouth	480969	6349071	open-water	level, discharge
S24	Athabasca River below Eymundson Creek	466305	6372764	all year	level, discharge, water temperature
S25	Susan Lake Outlet	464513	6368477	open-water	level, discharge
S26	MacKay River near Fort McKay (07DB001)	458019	6341008	Winter <sup>2</sup>	discharge
S27	Firebag River near the mouth (07DC001)	487914	6389855	Winter <sup>2</sup>	discharge
S29	Christina River near Chard (07CE002)	508211	6187940	Winter <sup>2</sup>	discharge
S31	Hangingstone Creek at North Star Road	469812	6236089	open-water	level, discharge, rainfall
S32	Surmont Creek at Highway 31	490250	6254524	open-water	level, discharge, water temperature
S33	Muskeg River at the Aurora/Albian Boundary	474878	6350204	all year	level, discharge, water temperature
S34	Tar River above Canadian Natural Lake	440745	6361662	all year	level, discharge, water temperature
S36	McClelland Lake Outlet above Firebag River	490635	6384056	open-water	level, discharge
S37	East Jackpine Creek near the 1300 m contour	487850	6325416	open-water	level, discharge
S38	Steepbank River near Fort McMurray (07DA006)	475296	6317398	Winter <sup>2</sup>	discharge
S39	Beaver River above Syncrude (07DA018)	465560	6311437	Winter <sup>2</sup>	discharge
S40	MacKay River at Petro-Canada Bridge	444949	6314178	all year	level, discharge, water temperature, rainfall
S42	Clearwater River above Christina River (07DC005)	504427	6279666	Winter <sup>2</sup>	discharge
S43	Firebag River upstream of Suncor Firebag	531704	6354796	open-water	level, discharge, water temperature, rainfall
S44	Pierre River near Fort McKay (Formerly 07DA013)	460769	6369299	open-water	level, discharge
S45	Ells River above Joslyn Creek Diversion	440325	6342418	all year	level, discharge, water temperature
S46	Athabasca River near Embarras Airport	470241	6463209	all year <sup>6</sup>	level, discharge, water temperature
S47	Christina River near the mouth	500697	6276412	all year <sup>6</sup>	level, discharge, water temperature
S48	Big Creek	470817	6389113	open-water <sup>7</sup>	level, discharge, water temperature
S49	Eymundson Creek near the mouth	465473	6372694	open-water <sup>6</sup>	level, discharge, water temperature

<sup>4</sup> C5 Pierre Climate Station began operation in October 2011.

<sup>5</sup> S16A replaced CR-1 (CNRL) and former RAMP S16 which all monitor the Calumet River near the mouth.

<sup>6</sup> Station began operation in August 2011.

<sup>7</sup> Station began operation in May 2011.

## C.2 CLIMATE DATA COLLECTED IN THE 2011 WATER YEAR

Climate data were collected in the region during the 2011 WY, defined as the period between November 1, 2010 and October 31, 2011. Data were collected by RAMP, Environment Canada, and other organizations. This document focuses on RAMP data and incorporates data from government agencies to provide context and supplement the RAMP information.

### C.2.1 RAMP Climate Data

In the 2011 WY, RAMP collected climatological data from five comprehensive climate stations, climate sensors at two RAMP lake stations, and through the use of five additional precipitation stations located in conjunction with select RAMP hydrometric stations. The following sections of this appendix present the data collected during the 2011 WY.

#### C.2.1.1 Aurora Climate Station (C1)

The Aurora Climate Station (C1) monitored air temperature, wind speed and direction, precipitation, solar radiation, and relative humidity during the 2011 WY. Table C.2-1 lists the data collected at the station. Monthly observations for the 2011 WY are summarized in Table C.2-2, and daily observations are contained in the RAMP database.

**Table C.2-1 Data collected at the RAMP Aurora Climate Station (C1), 2011.**

Climate Element and Sensor	Variable	Units	Derivation
Air Temperature Thermistor	Minimum	(°C)	Minimum of 1 minute means from readings every 5 sec.
	Mean	(°C)	Mean of readings every 5 sec.
	Maximum	(°C)	Maximum of 1 minute means from readings every 5 sec.
Total Precipitation OTT Pluvio2 Weighing Precipitation Gauge	Total	(mm)	Sum of 0.01 mm readings.
Depth of Snow on Ground Sonic level sensor	Total	(cm)	Average of 5 second readings made in the last minute of each 15 minutes.
Mean Relative Humidity Humidity sensor	Mean	(%)	Mean of readings every 5 sec.
Global Solar Radiation Pyranometer	Mean	(kW/m <sup>2</sup> )	Mean of readings every 5 sec.
Wind Speed and Direction Wind Vane and Propeller	Direction	(degrees)	Direction of daily mean wind vector from readings averaged every 5 sec.
	5 sec. Gust Speed	(km/h)	Maximum scalar wind speed from 5 sec readings.
	2 min. Gust Speed	(km/h)	Maximum of 2 minute scalar wind speed means from readings every 5 sec.
	10 min. Gust Speed	(km/h)	Maximum of 10 minute scalar wind speed means from readings every 5 sec.

**Table C.2-2 Summary of monthly climate data collected at the RAMP Aurora Climate Station (C1) during the 2011 WY.**

Month	Temperature			Total Precipitation Pluvio2 (mm)	Month End Depth of Snow on Ground (cm)	Mean Relative Humidity (%)	Mean Total Global Solar Radiation (kW/m <sup>2</sup> )	Maximum Sustained Wind Speeds		
	Min (°C)	Mean (°C)	Max (°C)					5 sec. (km/h)	2 min. (km/h)	10 min. (km/h)

Note: E = Estimated; M = Missing; P = Partial; See additional notes in sections C.2.1.1 and C.2.1.6.

### C.2.1.2 Horizon Climate Station (C2)

The Horizon Climate Station (C2) was established in October 2008 and became fully operational in June 2009. The Horizon Station monitored air temperature, wind speed and direction, solar radiation, relative humidity, barometric pressure, snow depth, and precipitation during the 2011 WY. Table C.2-3 lists the data collected at the station. Monthly observations for 2011 WY are summarized in Table C.2-4, and daily observations are contained in the RAMP database.

During the 2011 WY the station's power supply was disconnected by an unknown source on August 26. Full functionality was reinstated on September 12 during the next available visit to the station.

**Table C.2-3 Data collected at the RAMP Horizon Climate Station (C2), 2011.**

Climate Element and Sensor	Parameter	Units	Derivation
Air Temperature Thermistor	Minimum	(°C)	Minimum of 1 minute means from readings every 5 sec.
	Mean	(°C)	Mean of readings every 5 sec.
	Maximum	(°C)	Maximum of 1 minute means from readings every 5 sec.
Total Precipitation Geonor Weighing Precipitation Gauge	Total	(mm)	Sum of 0.05 mm readings every 15 minutes.
Depth of Snow on Ground Sonic level sensor	Total	(cm)	Average of 5 second readings made in the last minute of each hour.
Mean Relative Humidity Humidity sensor	Mean	(%)	Mean of readings every 5 sec.
Global Solar Radiation Pyranometer	Mean	(kW/m <sup>2</sup> )	Mean of readings every 5 sec.
Barometric pressure	Mean	KPa	Mean of readings every 5 sec.
Wind Speed and Direction Wind Vane and Propeller	Direction	(degrees)	Direction of daily mean wind vector from readings averaged every 5 sec.
	5 sec. Gust Speed	(km/h)	Maximum scalar wind speed from 5 sec readings.
	2 min. Gust Speed	(km/h)	Maximum of 2 minute scalar wind speed means from readings every 5 sec.
	10 min. Gust Speed	(km/h)	Maximum of 10 minute scalar wind speed means from readings every 5 sec.

**Table C.2-4 Summary of monthly climate data collected at the RAMP Horizon Climate Station (C2) during the 2011 WY.**

Month	Temperature			Total Precipitation (mm)	Month End Depth of Snow on Ground (cm)	Mean Relative Humidity (%)	Mean Total Global Solar Radiation (kW/m <sup>2</sup> )	Station Pressure (kPa)	Maximum Sustained Wind Speeds

Note: M = Missing, P = Partial. See additional notes in sections C.1.1.1 and C.2.1.6.

### C.2.1.3 Steepbank Climate Station (C3)

The Steepbank Climate Station (C3) was upgraded to a full climate station in November 2010. During the 2011 WY, air temperature, wind speed and direction, solar radiation, relative humidity, barometric pressure, snow depth, and precipitation data were collected at this station as described in Table C.2-5. Monthly observations for 2011 WY are summarized in Table C.2-6, and daily observations are contained in the RAMP database.

Records at the station are complete for the full 2011 WY, with the exception of a two-day gap on June 12 and 13, 2011.

**Table C.2-5 Data collected at the RAMP Steepbank Climate Station (C3), 2011.**

Climate Element and Sensor	Parameter	Units	Derivation
Air Temperature Thermistor	Minimum	(°C)	Minimum of 1 minute means from readings every 5 sec.
	Mean	(°C)	Mean of readings every 5 sec.
	Maximum	(°C)	Maximum of 1 minute means from readings every 5 sec.
Total Precipitation OTT Pluvio2 Weighing Precipitation Gauge	Total	(mm)	Sum of 0.01 mm readings.
Depth of Snow on Ground Sonic level sensor	Total	(cm)	Average of 5 second readings made in the last minute of each hour.
Mean Relative Humidity Humidity sensor	Mean	(%)	Mean of readings every 5 sec.
Global Solar Radiation Pyranometer	Mean	(kW/m <sup>2</sup> )	Mean of readings every 5 sec.
Barometric pressure	Mean	KPa	Recorded for every minute and averaged per 1 hour
Wind Speed and Direction Wind Vane and Propeller	Direction	(degrees)	Direction of daily mean wind vector from readings averaged every 5 sec.
	5 sec. Gust Speed	(km/h)	Maximum scalar wind speed from 5 sec readings.
	2 min. Gust Speed	(km/h)	Maximum of 2 minute scalar wind speed means from readings every 5 sec.
	10 min. Gust Speed	(km/h)	Maximum of 10 minute scalar wind speed means from readings every 5 sec.

**Table C.2-6      Summary of monthly climate data collected at the RAMP Steepbank Climate Station (C3) during the 2011 WY.**

Month	Temperature			Total Precipitation (mm)	Month End Depth of Snow on Ground (cm)	Mean Relative Humidity (%)	Mean Total Global Solar Radiation (kW/m <sup>2</sup> )	Station Pressure (kPa)	Maximum Sustained Wind Speeds

#### C.2.1.4 Pierre Climate Station (C4)

The Pierre Climate Station (C4) was installed on July 25, 2011. This station monitored air temperature, wind speed and direction, solar radiation, relative humidity, barometric pressure, snow depth, and precipitation from August to October 2011. Table C.2-7 provides a list of the data collected at the station. Monthly observations for 2011 WY are summarized in Table C.2-8, and daily observations are contained in the RAMP database.

**Table C.2-7 Data collected at the RAMP Pierre Climate Station (C4), 2011.**

Climate Element and Sensor	Parameter	Units	Derivation
Air Temperature Thermistor	Minimum	(°C)	Minimum of 1 minute means from readings every 5 sec.
	Mean	(°C)	Mean of readings every 5 sec.
	Maximum	(°C)	Maximum of 1 minute means from readings every 5 sec.
Total Precipitation OTT Pluvio2 Weighing Precipitation Gauge	Total	(mm)	Sum of 0.01 mm readings.
Depth of Snow on Ground Sonic level sensor	Total	(cm)	Average of 5 second readings made in the last minute of each hour.
Mean Relative Humidity Humidity sensor	Mean	(%)	Mean of readings every 5 sec.
Global Solar Radiation Pyranometer	Mean	(kW/m <sup>2</sup> )	Mean of readings every 5 sec.
Barometric pressure	Mean	KPa	Recorded for every minute and averaged per 1 hour
Wind Speed and Direction Wind Vane and Propeller	Direction	(degrees)	Direction of daily mean wind vector from readings averaged every 5 sec.
	5 sec. Gust Speed	(km/h)	Maximum scalar wind speed from 5 sec readings.
	2 min. Gust Speed	(km/h)	Maximum of 2 minute scalar wind speed means from readings every 5 sec.
	10 min. Gust Speed	(km/h)	Maximum of 10 minute scalar wind speed means from readings every 5 sec.

### C.2.1.5 Climate Variables at Other RAMP Stations

Table C.2-9 summarizes the climate variables monitored at RAMP stations other than the Aurora, Horizon, Steepbank, and Pierre Climate stations.

Annual precipitation was monitored at stations L1 (using a Pluvio weighing gauge) and L2 (using a Geonor weighing gauge), with rainfall also being measured from April to October of 2011 at stations S3, S19, S31, S40, and S43 using tipping bucket rain gauges.

Barometric pressure was monitored at Station S5A throughout the 2011 WY.

Table C.2-9 to Table C.2-11 provide a monthly summary of the climate data collected at other RAMP stations. Daily monitoring data are included in the RAMP database. Daily cumulative precipitation and rainfall depths at the various stations are compared to precipitation recorded at other regional stations in Figure C.2-1 and Figure C.2-2.

**Table C.2-9      Climate data collected at other RAMP stations, 2011.**

Station	Variable	Sensor
L1 McClelland Lake	Precipitation	Weighing Gauge
	Water Temperature	Thermistor
	Air Temperature	Thermistor
	Relative Humidity	Humidity Sensor
L2 Kearl Lake	Precipitation	Geonor Precipitation Gauge
	Water Temperature	Thermistor

**Figure C.2-1 Annual Precipitation at Fort McMurray and RAMP climate stations, 2011 WY.**

Note: Missing data at Station C2 was extrapolated using data from station C4 from August 26 to September 12.  
Missing data at Station C3 was extrapolated using EC Mildred Lake Station data.

**Figure C.2-2 Rainfall at Fort McMurray and RAMP climate stations, 2011 WY.**

Note: Missing data at Station C2 was extrapolated using data from station C4 from August 26 to September 12.

### C.2.1.6 RAMP Database

RAMP Climate and Hydrology data are available on-line through the RAMP database ([www.ramp-alberta.org](http://www.ramp-alberta.org)). The 2011 WY data are published to the RAMP website in May 2012 upon the completion of the QA/QC process for data management. The following notes apply to the monthly climate data (Table C.2-2, C.2-5, C.2-6, C.2-8, C.2-9, C.2-10, C.2-11, and C.2-12) and to the daily data, which are publically available and provided in the RAMP database:

- Time distribution of snowfall is sometimes recorded with a lag-time of approximately three to six hours (and less than one day);
- Precipitation measurement, including tipping bucket rain gauges, do not differentiate between rainfall and snowfall; therefore, the values recorded represent total precipitation for the associated period of record;
- Wind direction, from which the wind is blowing, is reported in degrees clockwise from North;
- Reported monthly climate data include extreme minimum and maximum temperature data; mean temperature and relative humidity; and total precipitation and solar radiation; and
- Reported annual values include extreme minimum and maximum temperature; mean temperature, relative humidity and solar radiation; and total precipitation.

### C.2.1.7 2011 Snow Course Survey Results

Snow course surveys were completed at sites representing four general terrain types across the RAMP study area:

- Flat low lying areas (FL);
- Open land or lake areas (OP);
- Mixed deciduous (MD); and
- Jackpine (JP).

Locations of the snow course surveys are shown on Figure 3.1-1 in the main report.

Snow course surveys were completed from February 8 to 12, March 7 to 14, March 31 to April 4, 2011, with selected extra surveys on April 13 following a late-season snowfall event. The results organized by land cover type are shown in Table C.2-12 and organized by region are shown in Table C.2-13. Snow survey data are also available through the RAMP database.

## C.2.2 Climate Data from Government Agencies

Daily climate data published by Environment Canada for climate stations in the study area have been incorporated into the RAMP database. An inventory of data obtained from these stations is provided in Section C.5.

As of 2009, Environment Canada climate data includes data collected at the Fort McMurray and Mildred Lake stations. Data from the Forestry lookout station are no longer being processed by Environment Canada.

**Table C.2-12    Summary of the RAMP snow course surveys organized by land cover type, winter 2011.**

Terrain Type	Survey ID	February (Feb 8 to 12)		March (Mar 7 to 14)		April (Mar 31 to Apr 4)	
		Snow Depth (cm)	SWE (mm)	Snow Depth (cm)	SWE (mm)	Snow Depth (cm)	SWE (mm)

## C.3 HYDROMETRIC DATA COLLECTED IN THE 2011 WY

Hydrometric data for the region were collected throughout the 2011 WY. RAMP Climate and Hydrology data are available on-line through the RAMP website ([www.ramp-alberta.org](http://www.ramp-alberta.org)). The 2011 WY data is published to the RAMP website in May 2012 upon the completion of the QA/QC process for data management.

### C.3.1 RAMP Hydrometric Data

Hydrometric data, including water level and discharge, were collected for the region during the 2011 WY. These data were collected at hydrometric monitoring stations where near-continuous water level data were recorded using pressure transducers and data loggers. Discharge rating curves, developed and maintained for each station, were applied to develop flow values from the recorded water level data. Suspended sediment samples were also collected at 34 RAMP hydrometric stations during the 2011 WY.

#### C.3.1.1 Water Level and Discharge

Table C.3-1 summarizes RAMP hydrometric monitoring in the 2011 WY. The quality assessment shown for each station record was based on an assessment matrix which considers the number and quality of discharge measurements made during the year, the quality and extent of the stage-discharge rating curve, and the record completeness.

Data quality for the 2011 WY was generally good (34 of 39 locations) with wildlife, wildfire, and equipment attrition affecting the 2011 WY hydrometric record at 11 stations as described below:

- The pressure transducer at McClelland Lake (Station L1) was encased in ice on January 23 due to extreme cold conditions, which affected water level measurements until the ice around the pressure transducer thawed on May 12.
- A faulty voltage regulator caused Station S10, Wapasu Creek at Canterra Road, to lose power on December 13, 2010. The voltage regulator was replaced on the next station visit on January 15, 2011 and station function was reinstated.
- The pressure transducer at Station S14A, Ells River near the CNRL Bridge, failed on July 24, 2011. A new pressure transducer and datalogger were installed on August 12 to reinstate the station.
- Station S15A, Tar River near the mouth, was damaged by wildfire on June 23, 2011. The station was reinstalled and became fully operational on August 12.
- Station S16A, Calumet River near the mouth, was damaged by wildfire in spring 2011 (the exact date is unknown given the datalogger melted from the fire). The station was replaced with a new datalogger and pressure transducer on July 27 when field crews were able to access the area.
- The datalogger malfunctioned at Station S19, Tar River Lowland Tributary near the mouth, after installation on April 19, 2011. Data recording was reinstated on June 24 when a replacement datalogger was installed at the station.
- A wildfire damaged the pressure transducer at Station S24, Athabasca River below Eymundson Creek, on June 2, 2011. Station function was reinstated during the following station visit on June 18.

- The pressure transducer at Station S31, Hangingstone Creek at Northstar Road, malfunctioned shortly after installation in late April and was replaced with a newly-calibrated pressure transducer on June 20.
- Station S36, McClelland Lake outlet, was damaged on May 8, 2011 by wildfire. The station was repaired on July 27 when field crews were able to access the area.
- The pressure transducer at Station S45, Ells River above Joslyn Creek Diversion, was damaged by wildlife on September 27, 2011. Station function was reinstated on October 28.
- The pressure transducer wiring at Station S48, Big Creek, was damaged on June 1, 2011 by an unknown source. The pressure transducer was rewired on July 28 to reinstate the full function of the station.

Data quality at the following six stations was compromised due to backwater effects caused by beaver activity:

- S09, Kearn Lake Outlet;
- S10, Wapasu Creek at Canterra Road;
- S19, Tar River Lowland Tributary;
- S20, Muskeg River Upland;
- S36, McClelland Lake Outlet above Firebag River; and
- S50, Red Clay Creek.

**Table C.3-1 Summary of RAMP hydrometric monitoring during the 2011 WY.**

Watershed and Station	Catchment Area (km <sup>2</sup> )	Monitored Period 2011 WY	Percent of Open Water Period Record Available	Maximum Daily Discharge (Water Year: Nov 1 2010 - Oct 31 2011)		Minimum Daily Discharge (Open Water Season: May 1 - Oct 31 2011)		Runoff Volume (Open Water Season: May 1 - Oct 31 2011)

\* See Section C.2.1.1 for details of missing data.

Means were calculated from years with greater than 85% of data for the required period.

Volumes presented to 3 significant figures.

### C.3.1.2 Suspended Sediment

Suspended sediment samples were collected at 34 RAMP stream flow stations for a total of 112 measurements in the 2011 WY. The total suspended sediment (TSS) data are provided in Table C.3-2. Discharge (Q) shown in the table is the manual discharge measurement at the time the sample was collected where available.

**Table C.3-2 Suspended sediment data collected at RAMP hydrometric stations during the 2011 WY.**

### C.3.2 Hydrometric Data from Focal Projects

Several oil sands operators provided stream flow and operational water withdrawal and release data to RAMP, as summarized in Table C.3-3.

### C.3.3 Hydrometric Data from Government Agencies

Daily discharge data are published by Environment Canada, including data for WSC hydrometric stations that are within the RAMP study area. In some cases, RAMP provides winter monitoring at seasonal WSC stations to extend the record to cover the

full year. For stations where RAMP monitors to supplement the Environment Canada data record, the full period of record including both RAMP and WSC data have been incorporated into the RAMP database. Data flagging protocols are used in the database to identify data sources. An inventory of the data obtained for the stations is provided in Section C.5.

**Table C.3-3 Hydrometric information for 2011 WY received from oil sands operators and incorporated into the water balance analyses.**

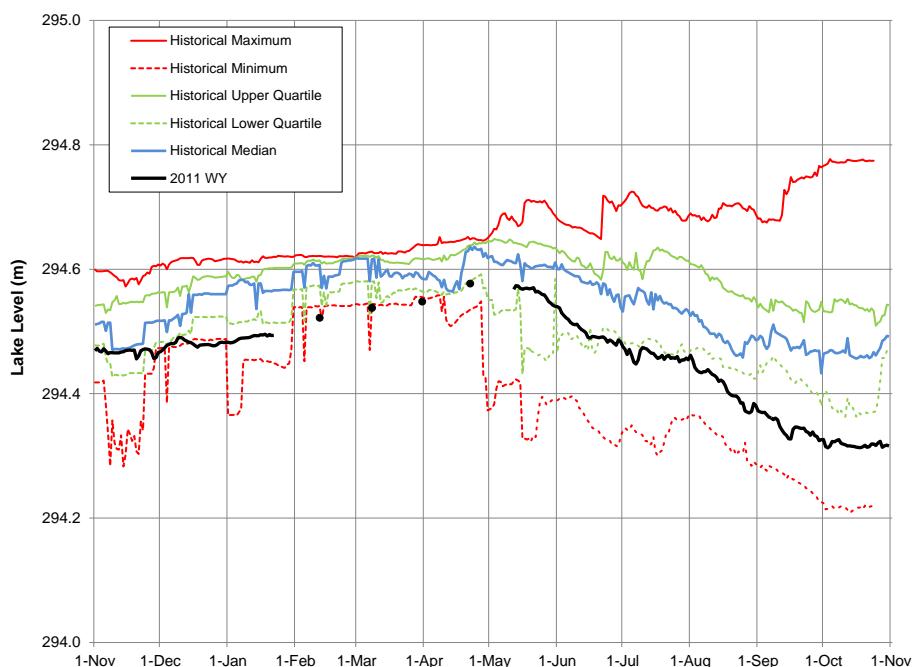

Operator	Watershed	Activity	Annual Volume (dam <sup>3</sup> )	Location (if provided)	Time-step
CNRL - Horizon	Athabasca	Withdrawals from Athabasca River	10,300	SW14-96 W4M	Daily
Cenovus	Christina	Water withdrawals	69	Various	Daily
Nexen	Christina	Water withdrawals	33	Various	Daily
Total E&P Canada Ltd.	Ells	Water withdrawals from various sites	6	Various	Daily
	Athabasca	Water withdrawals	5	NE-26-095-11	
	Muskeg	Aurora Clean Water Diversion to Stanley Creek	8,900	21-096-09-W4M	Daily
Syncrude	Athabasca	Treated Sewage Releases to Athabasca River	310	02-093-10-W4M	Monthly
		Withdrawals from Athabasca River	36,300	35-096-09-W4M	
	Poplar Creek	Diversion from Beaver Creek into Poplar Creek	1,100		Daily
Shell – Jackpine Mine	Athabasca	Withdrawals from Athabasca River	11,700	476508E, 6347999N	Daily
Shell – Muskeg River Mine	Athabasca	Withdrawals from Athabasca River	12,100	461422.87E , 6346082.31N	Daily
		Water withdrawals	120		Daily
Suncor Energy Ltd.	Athabasca	Withdrawals from the Athabasca River	28,100	Various	Daily
		Releases to the Athabasca River	3,400		
	Steepbank	Water withdrawals	6	Various	Daily
		Water releases	110		
	Muskeg	Water withdrawals	11	Various	Daily
		Water releases	1		
	Firebag	Water Releases	98	Various	Daily
		Water withdrawals	<1		
Imperial Oil Resources	MacKay	Water withdrawals	3	SE-18-093-12-W4	Daily
	Athabasca	Withdrawals from Fort Hills	23	461020E, 6356390N	Daily
	Firebag	Withdraw from Moose Creek	2	490126E, 6374068	

Note: The above data were used in the water balance calculations described in Section 5. Further information was received from industry but not included within the water balance calculations. This includes: (i) data classified as muskeg dewatering, groundwater extraction or other processes not affecting natural surface watercourses and waterbodies; (ii) operator withdrawal and discharge data located downstream of the corresponding observed test monitoring location; and (iii) focal project withdrawal and discharges occurring on days when observed test monitoring did not occur (e.g., during winter months for open-water monitoring stations, or when data collection was prevented due to forest fires or other reasons). Values are presented to the nearest dam<sup>3</sup> for values under 100 dam<sup>3</sup>, to the nearest 10 dam<sup>3</sup> for values between 100-1000 dam<sup>3</sup>, and to the nearest 100 dam<sup>3</sup> for values above 1000 dam<sup>3</sup>.

### C.3.4 2011 WY Hydrographs in Historical Context

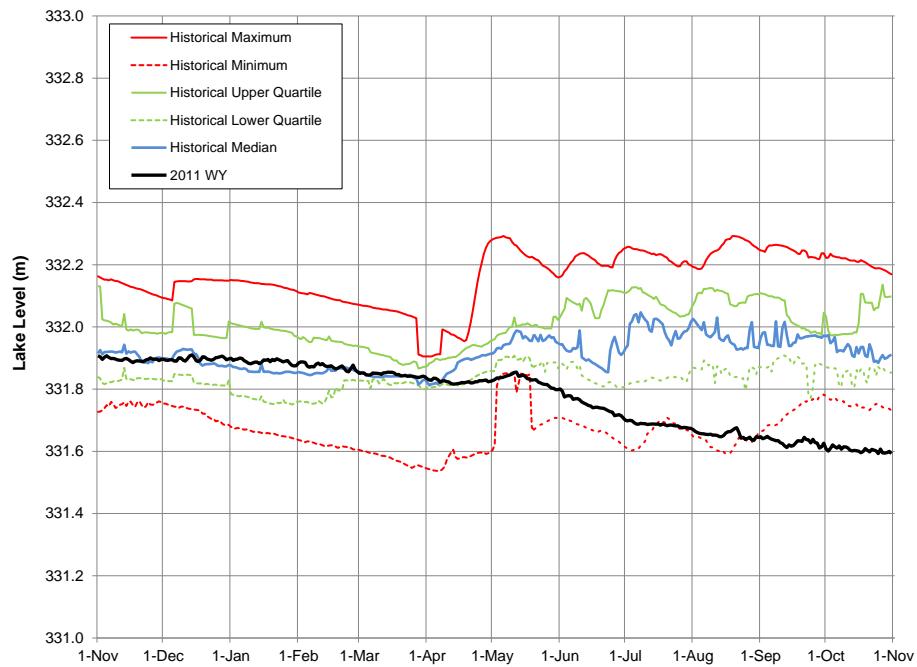

Discharge and water level hydrographs for the 2011 WY, for each RAMP station, are presented in Figure C.3-1 to Figure C.3-42. Historical maximum, minimum, and median daily values are also provided to assist with interpretation. Stations S43, S44, S45, S46, S47, S48, S49, and S50 do not contain more than two open-water seasons of historical data, and historical data are; therefore, not shown for these stations. In all cases, the current year was excluded from the calculation of the historical context, so that the current year is compared to the previous years.

**Figure C.3-1 2011 WY water level hydrograph and historical context for Station L1, McClelland Lake.**

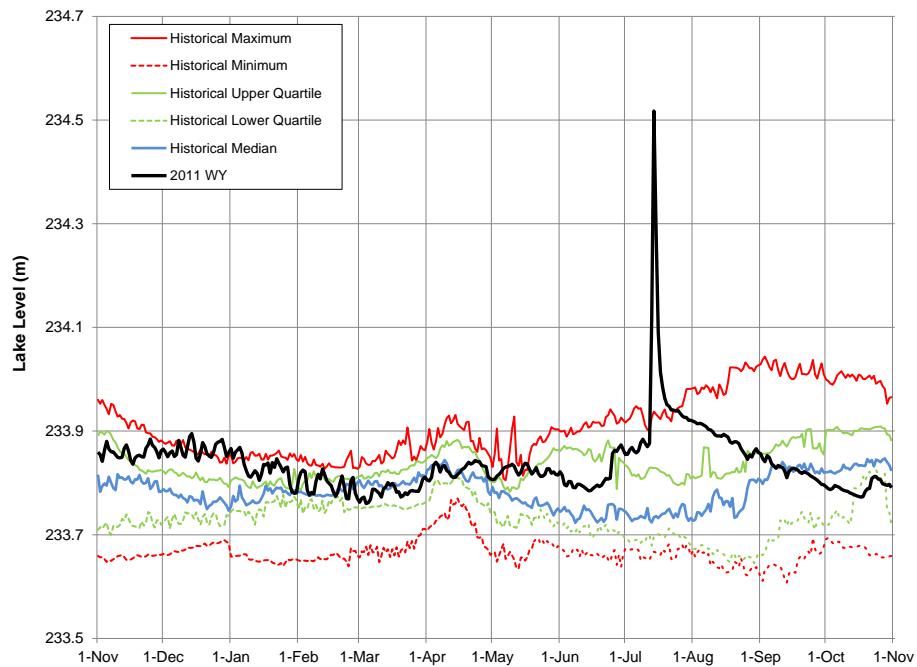

Note: Missing continuous data occurred from January 23 to May 11, 2011 because the pressure transducer was encased in ice. Available manual measurements are presented during this period.

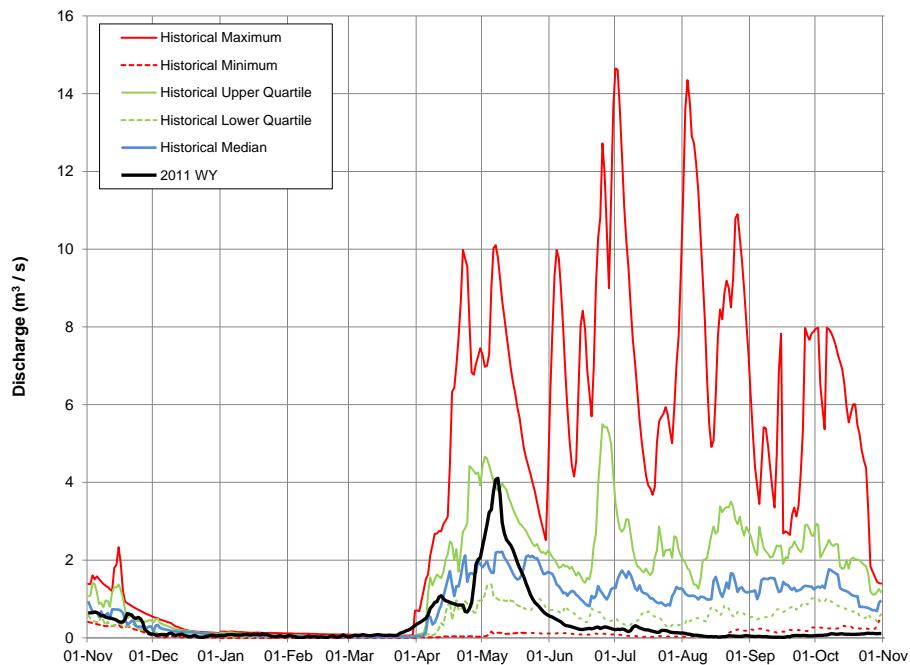

**Figure C.3-2 2011 WY water level hydrograph and historical context for Station L2, Kearn Lake.**

**Figure C.3-37 2011 WY discharge hydrograph for Station S45, Ells River above Joslyn Creek Diversion.**

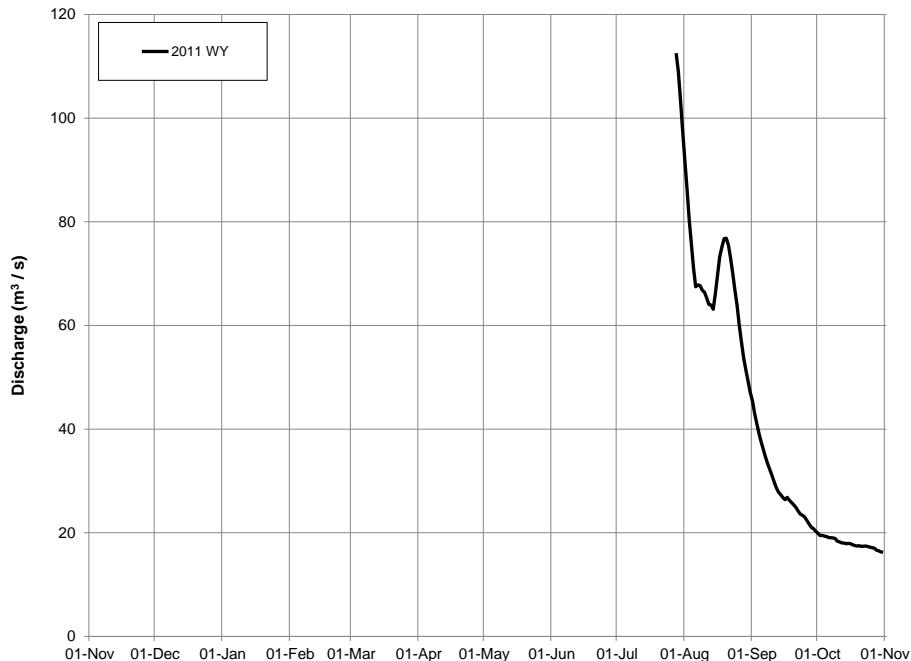

**Figure C.3-38 2011 WY discharge hydrograph and historical context for Station S46, Athabasca River near Embarras Airport.**

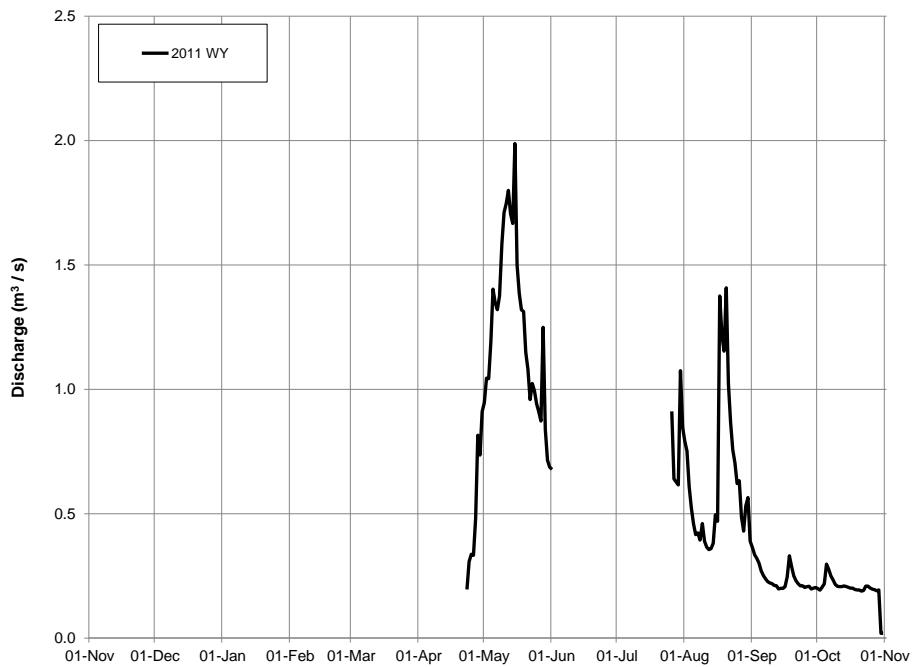

Note: Historic statistics are based on data from WSC Station 07DD001 (1971 to 1984).

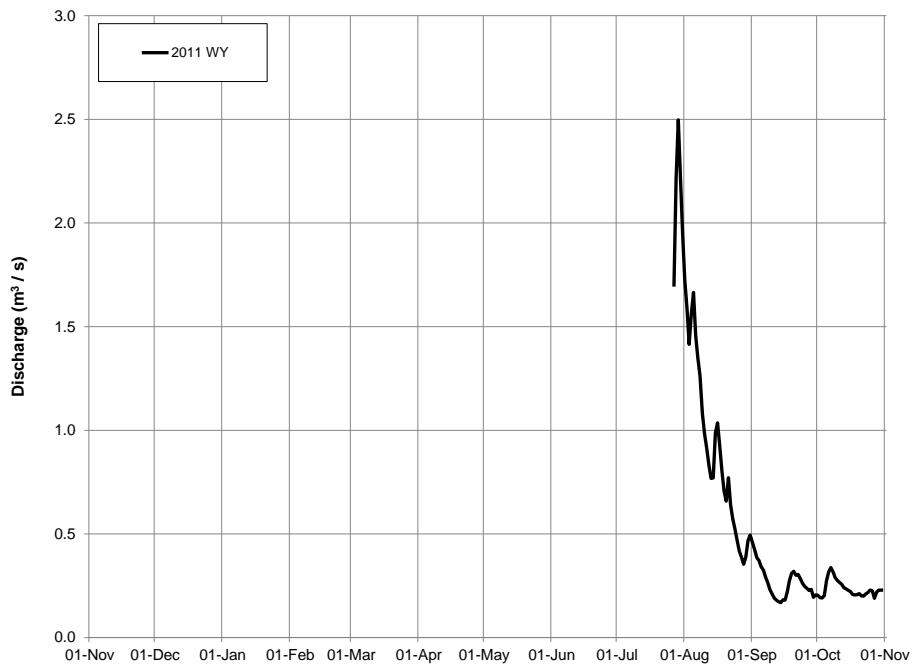

**Figure C.3-39 2011 WY discharge hydrograph for Station S47, Christina River near the mouth.**

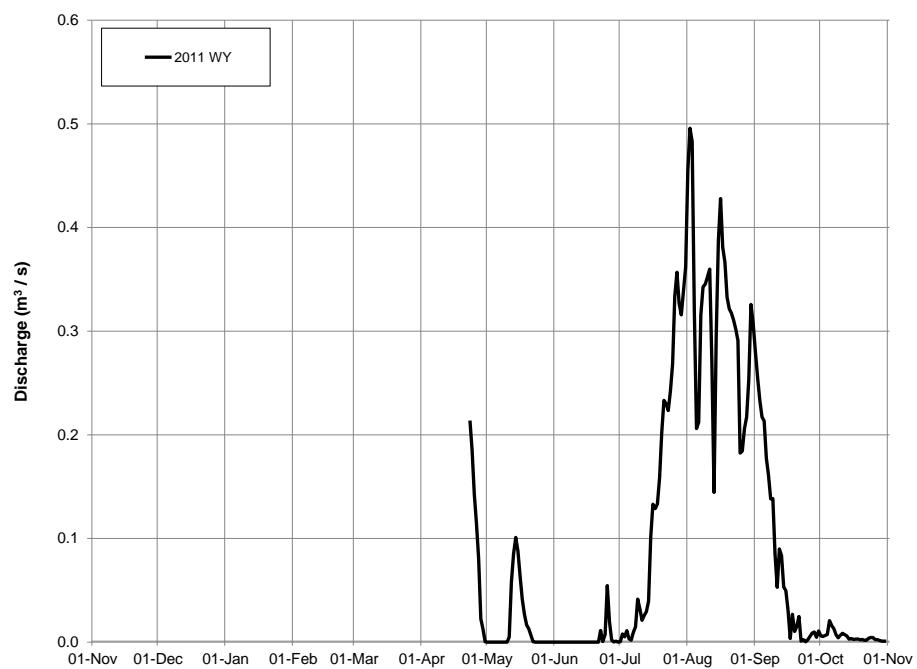

**Figure C.3-40 2011 WY discharge hydrograph for Station S48, Big Creek.**

**Figure C.3-41 2011 WY discharge hydrograph for Station S49, Eymundson Creek near the mouth.**

**Figure C.3-42 2011 WY discharge hydrograph for Station S50, Red Clay Creek.**

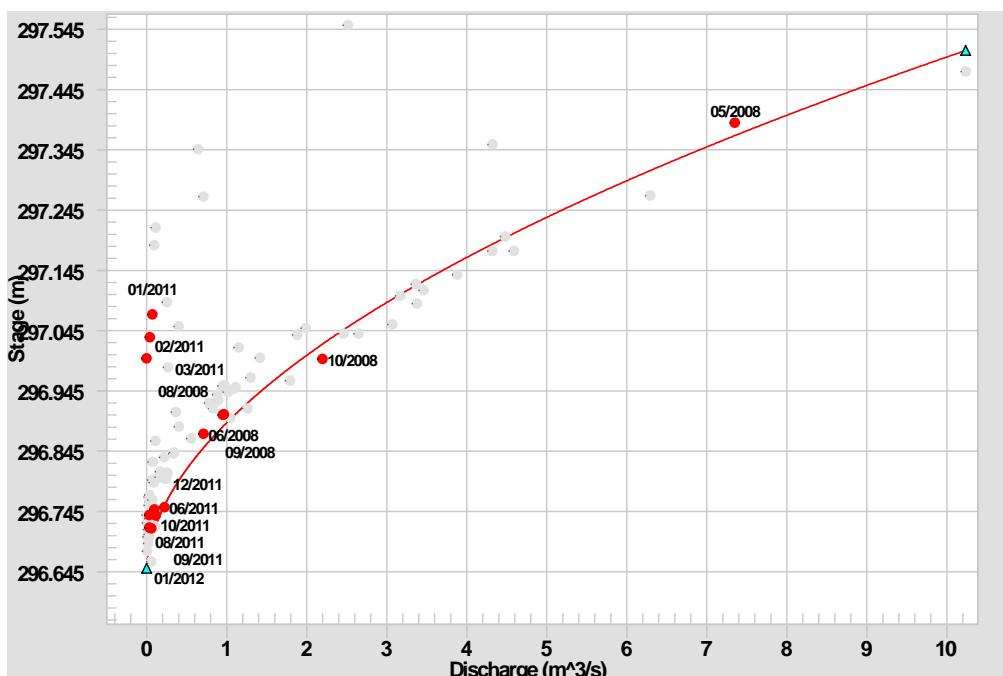

Note: The 2011 WY hydrograph is an estimate and for reference purposes only. There was substantial backwater during the 2011 open water period resulting in a poor stage-discharge relationship.

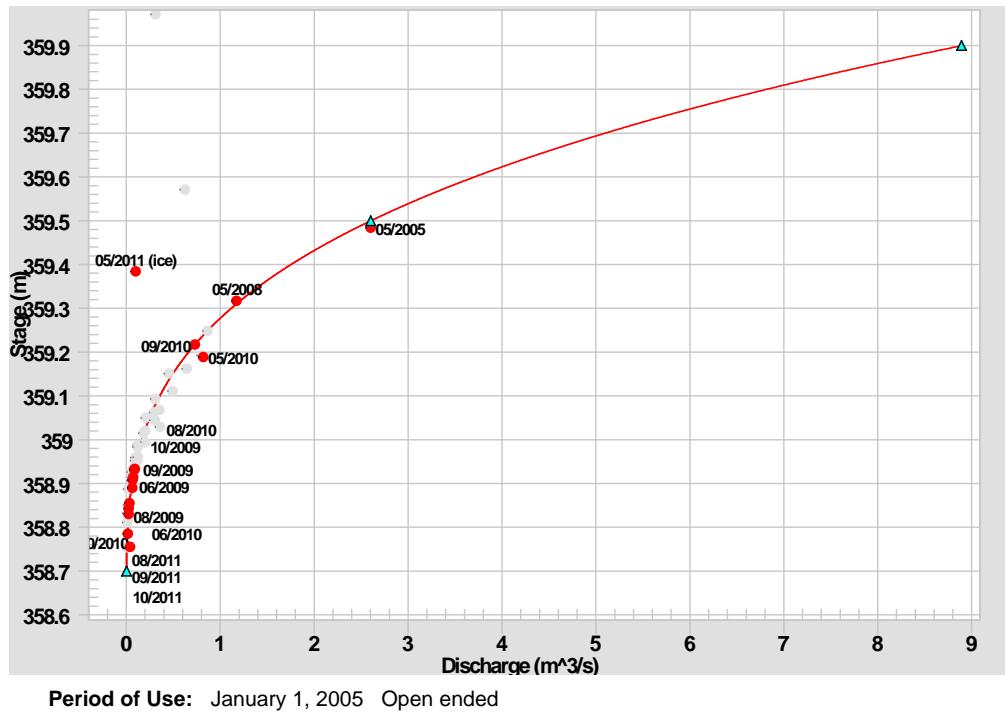

### C.3.5 Stage-Discharge Rating Curves

Water level and discharge measurements were used to derive and/or update stage-discharge rating curves. The derived rating curves are shown graphically for each station in Figure C.3-43 to Figure C.3-81. In each graph, the red line denotes the most current stage-discharge rating curve; green line denotes the previous stage-discharge rating curve; grey circles denote historical manual discharge measurements; red circles denote manual discharge measurements used to develop the current stage-discharge rating curve; and the green triangles denote rating points that define the stage-discharge rating curve. In cases where there is no green line, the current stage-discharge rating curve has not changed from the previous sampling year.

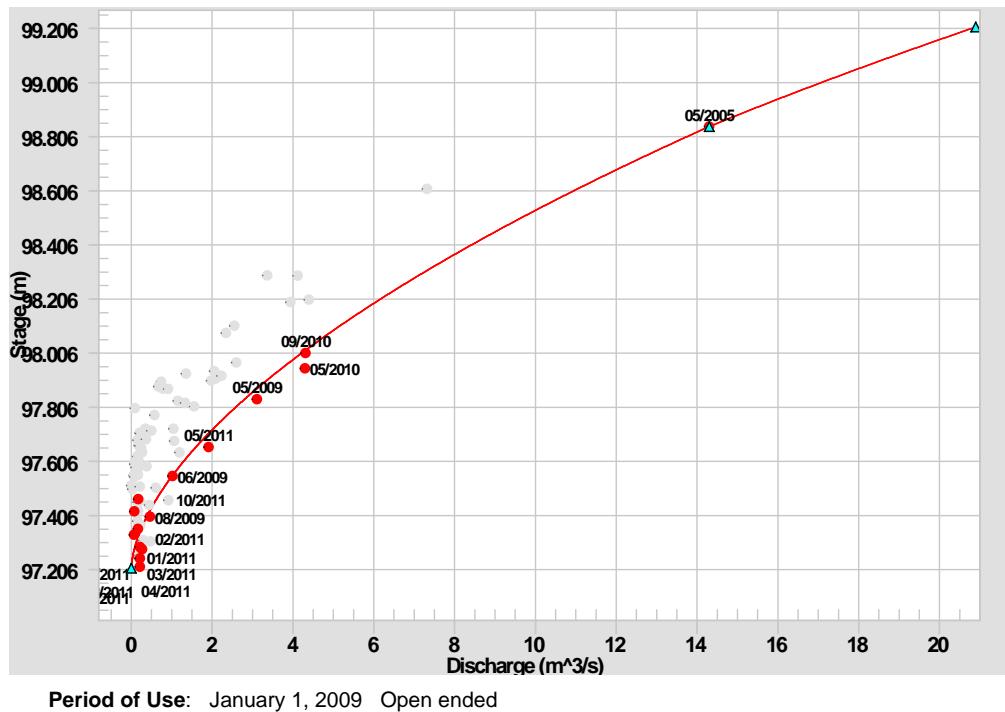

**Figure C.3-43 Stage-discharge rating curve for RAMP Station S2, Jackpine Creek at Canterra Road.**

## C.4 NATURALIZED FLOW CALCULATION

### C.4.1 Introduction

A water balance approach was used to assess hydrologic impacts on the flow regime experienced at the mouth of major tributaries of the Athabasca River within the oil sands region. This analytical approach is considered useful in that the difference between observed and naturalized flows can be calculated using recorded and calculated flow inputs and outputs.

The water balance approach involved the calculation of a naturalized hydrograph by accounting for flow inputs and outputs that have affected the observed hydrograph at a particular location. By adding back into the observed hydrograph flows that would have occurred under natural conditions, and by subtracting flows that would not have occurred naturally, but have been added to the system through human intervention (flows added as a result of industrial activity such as industrial flow releases and land-use changes), a naturalized hydrograph for the location was calculated. The observed hydrograph and the naturalized hydrograph were compared to assess the impacts to the flow regime at the specified location.

Details of the procedure are provided below.

### C.4.2 Rationale

#### C.4.2.1 Water Balance

In general, the water balance for a partially-developed catchment (that is, a catchment that has been affected by land clearing, hydrologic isolation, and water withdrawals and releases from watercourses) may be considered as follows:

$$Hyd_B = Hyd_O + I_w - I_r + R_n - R_i \quad (1)$$

where:

$Hyd_B$  is the *baseline* hydrograph;

$Hyd_O$  is the *test* hydrograph which was observed;

$I_w$  are the focal project withdrawals from the watershed;

$I_r$  are the focal project releases to the watershed;

$R_n$  is the natural runoff that would have occurred in the watershed, but was intercepted or closed-circuited by focal projects; and

$R_i$  is the incremental increase in runoff caused by land cleared within the watershed.

For catchments monitored as part of the RAMP program, the observed discharge was the discharge measured at streamflow stations near the catchment outlet. Most streamflow stations were operated by RAMP, but some were operated by government, or by a combination of government and RAMP.

Water withdrawals and releases were obtained from industry reports. In most cases, daily discharges were reported. In other cases the withdrawal or release discharge was reported as a monthly or annual volume, and the corresponding daily discharges were estimated by RAMP.

The effects of clearing and of hydrologic isolation were estimated as discussed in the following sections.

The natural flow,  $Hyd_B$  was initially unknown and estimated by solving Equation 1 using information on the other components of the water balance. Because some of the other components were not known precisely, and because the water balance equation omits factors such as changes in surface water discharge in response to groundwater extraction,  $Hyd_B$  was referred to as “naturalized”, rather than “natural”.

#### C.4.2.2 Effect of Clearing

The effect of clearing was estimated by assuming a 20% increase in average runoff depth in cleared areas. This assumption provided an approximate estimate of increased runoff. A more precise assessment would require consideration of the following factors:

- The effect of clearing on runoff is not well defined and may vary significantly depending on the soil type, initial vegetation, and other factors; and
- When land is cleared, the runoff is frequently treated in settling ponds, which may have sufficient capacity to attenuate the runoff and appreciably affect the discharge hydrograph.

Using an assumption of a constant increase in average runoff depth was considered to be appropriate for reviewing changes in flow characteristics when evaluated at the mouth of the tributaries, because the cleared area is usually small compared to the total catchment area.

#### C.4.2.3 Closed-Circuited Areas

Closed-circuited (or hydrologically isolated) areas were delineated based on satellite imagery and reviewed by oil sands operators (Table C.4-1). It was assumed that zero runoff was released to the environment from closed-circuit areas.

The definition of “effective area” used in the water balance analyses was the area of the catchment remaining after removal of the closed-circuited areas. The effective area includes both cleared and natural areas that were not closed-circuited by development activities. All areas of the watershed that were not closed-circuited were included in the effective area for the purposes of the water balance analyses. The effective area as defined for this analysis may include areas that were ineffective in the classic hydrological sense of areas that do not contribute runoff to the stream during normal (up to 1:2 year) runoff events.

**Table C.4-1      Area of each watershed that was cleared or hydrologically closed-circuited, 2011.**

Watershed	Total Area <sup>1</sup> (km <sup>2</sup> )	Closed-Circuit Area (km <sup>2</sup> )	Cleared Area (km <sup>2</sup> )
Athabasca River <sup>2</sup>	146,000	574	369
Muskeg River	1,457	118.7	69.0
Steepbank River	1,320	4.9	40.1
Tar River	326	63.6	26.3
MacKay River	5,569	5.4	12.6
Calumet River	173.5	1.9	0.4
Firebag River	5,988	2.6	42.8
Ells River	2,450	1.6	16.5
Christina River <sup>2</sup>	13,038	6.8	53.6
Hangingstone River	962	0.5	0.1
Poplar Creek	151	3.1	1.8
Fort Creek	31.9	0.3	19.7

<sup>1</sup> Area is reported for the stream monitoring station.

<sup>2</sup> Values reported for all oil sands projects in these watersheds.

### C.4.3 Water Balance Procedure

In order to calculate the naturalized hydrograph, the observed discharge was first adjusted to remove the effects of industrial water withdrawals and releases. The resulting discharge represented the observed runoff ( $R$ ) from the contributing portion of the catchment. The observed runoff was then converted to a naturalized runoff depth ( $d$ ), accounting for the effects of clearing. The naturalized runoff depth was used to calculate the naturalized discharge for the catchment ( $Hyd_B$ ). The natural flow that would have occurred from industrially closed-circuited areas ( $R_n$ ), and the incremental flow from cleared areas ( $R_i$ ) were also calculated. This process is shown in equation form below:

$$R = Hyd_O + I_w - I_r \quad (2)$$

$$d = \frac{R}{[A_E + (A_C \times F)]} \times C \quad (3)$$

$$Hyd_B = \frac{A \times d}{C} \quad (4)$$

$$R_n = \frac{A_{HI} \times d}{C} \quad (5)$$

$$R_i = \frac{A_C \times d \times F}{C} \quad (6)$$

where:

- A is the total catchment area ( $\text{km}^2$ );
- $A_C$  is the cleared area in the catchment ( $\text{km}^2$ );
- $A_E$  is the effective area (i.e. A -  $A_{HI}$ ) ( $\text{km}^2$ );
- $A_{HI}$  is the closed-circuit area ( $\text{km}^2$ );
- C is the conversion factor from  $\text{m}^3/\text{s}/\text{km}^2$  to  $\text{mm}/\text{yr}$ ;
- d is the naturalized runoff depth (mm);
- F is the adjustment factor to account for clearing (0.20);
- R is the observed runoff from the effective area adjusted for reported industrial withdrawals and releases ( $\text{m}^3/\text{s}$ ); and

Other symbols are as defined previously. The water balance calculation is done at a daily time step.

### C.4.4 Previously Published Estimates

Naturalized flows provided in the RAMP reports in 2005–2007 were estimated using methods similar to, but slightly different than, the procedure described above. Estimates for 2005–2007 were revised to be consistent with the method used from 2008 to 2011, which reflects more accurately a naturalized water balance, and these revisions were presented in the RAMP 2008 report. The assumption of differences in runoff response between upland and lowland terrain, previously applied to closed-circuited areas, was not applied due to the lack of a reliable and consistent approach for all watersheds.

## **C.5 UPDATED STATION DESCRIPTION SHEETS**

Updated station description sheets are provided below for all stations that were active in the 2011 WY.

Revised 26 March, 2012

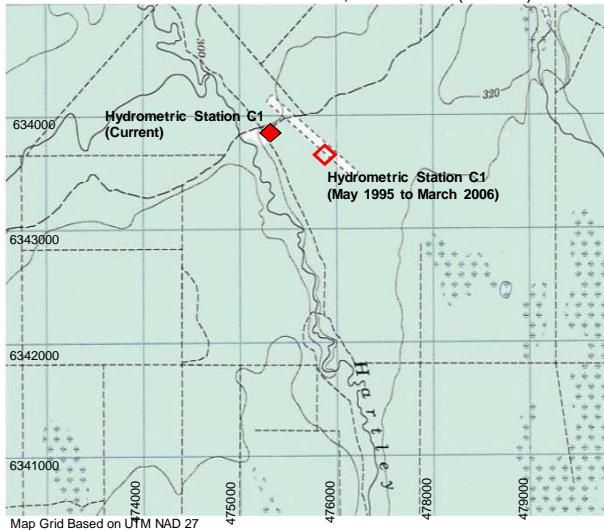

### Location and Purpose

Established in May 1995 to monitor climate conditions in the Muskeg River basin. Formerly Station 271 for the OSLO project - 1988 data available.

<b>Variables Measured:</b>	Air Temperature, Relative Humidity, Wind Speed, Wind Direction, Snow Depth, Precipitation, and Solar Radiation
<b>Period of Record:</b>	March 2006 to Present
<b>Access:</b>	Truck Via Canterra Road and Jackpine Mine
<b>Coordinates:</b>	475230 E, 6344049 N (NAD 83)
<b>Station Elevation:</b>	Geodetic elevation of station based on 2011 differential GPS program 308.5 ± 0.5m

### Previous Locations

<b>Period:</b>	May 1995 to March 2006
<b>Coordinates:</b>	475734E, 6343967 N (NAD83)

Revised 26 March, 2012

### Location and Purpose

Established in October 2008 to monitor climate conditions in the Tar River basin.

**Variables Measured:** Air Temperature, Relative Humidity, Wind Speed, Wind Direction, Snow Depth, Precipitation, Solar Radiation, and Barometric Pressure

**Period of Record:** October 2008 to Present

**Active:** Year Round

**Access:** 4WD Truck Via CNRL Horizon

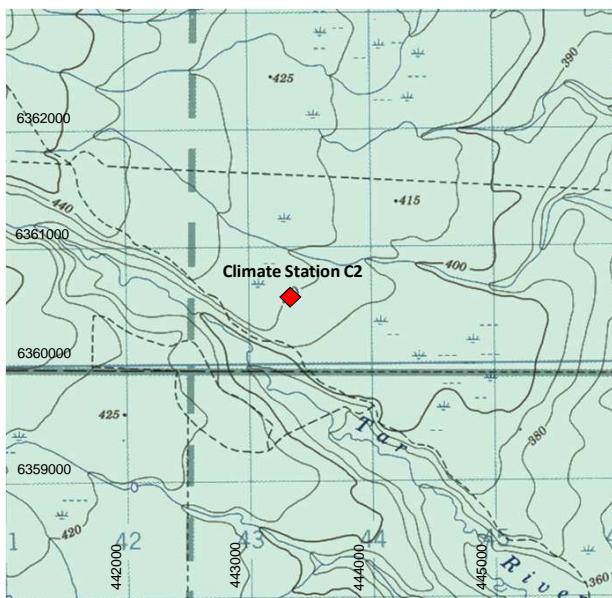

**Lat/Long:** 57°23'02" N, 111°56'31" W

**Coordinates:** 12 V 443364 E, 6360515 N (NAD 83)

**NTS Map:** 74E05

**Station Elevation:**

Geodetic elevation of station based on 2011 differential GPS program 412 ±0.5m

Revised 26 March, 2012

### Location and Purpose

Established in August 2009 to monitor precipitation in the Steepbank River area.

**Variables Measured:** Air Temperature, Relative Humidity, Wind Speed, Wind Direction, Snow Depth, Precipitation, Solar Radiation, and Barometric Pressure

**Period of Record:** August 2009 to Present

**Active:** Year Round

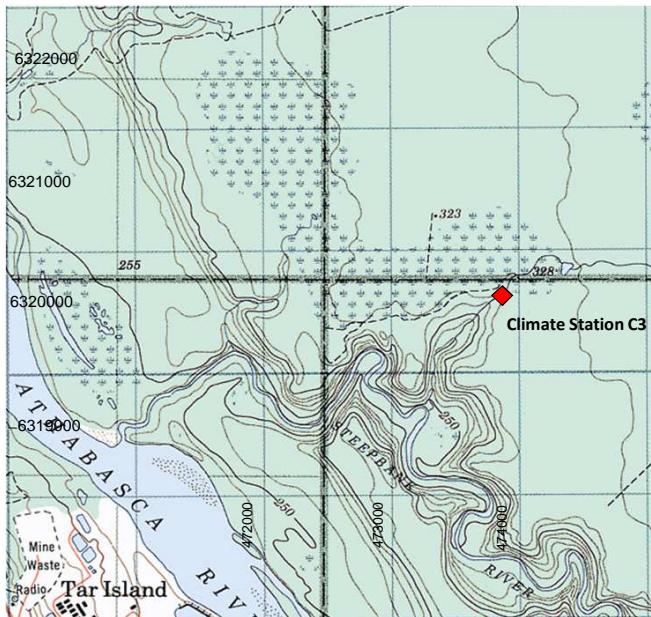

**Access:** 4WD Truck Via Suncor

**Lat/Long:** 57°01'38.4" N, 111°25'45.1" W

**Coordinates:** 12 V 473950 E, 6320500 N (NAD 83)

**NTS Map:** 74E03

**Station Elevation:** Estimated Geodetic Elevation 328 m ± 5m

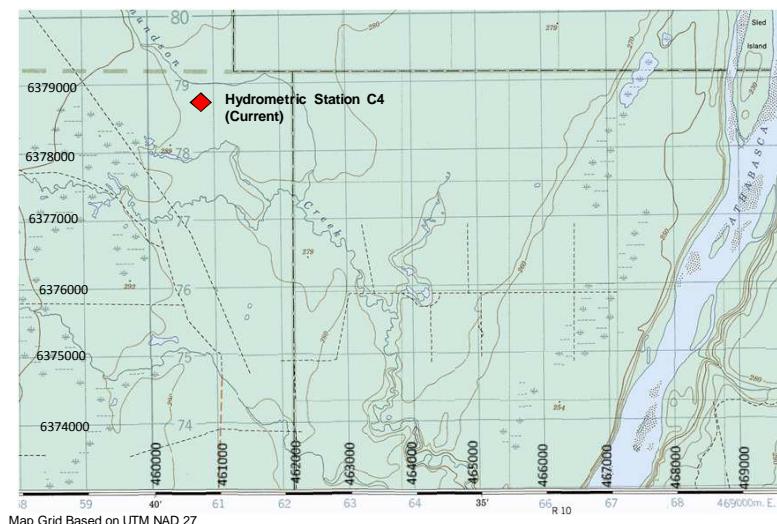

Revised 26 March, 2012

### Location and Purpose

Established in July 2011 to monitor climate conditions on the west side of the Athabasca River north of all current development.

<b>Variables Measured:</b>	Air Temperature, Relative Humidity, Wind Speed, Wind Direction, Snow Depth, Precipitation, Solar Radiation, and Barometric Pressure
<b>Period of Record:</b>	July 2011 to Present
<b>Access:</b>	Helicopter
<b>Coordinates:</b>	460853 E, 6378740 N (NAD 83)
<b>Station Elevation:</b>	Geodetic elevation of station based on 2011 differential GPS program 291.5 ± 0.5m

Revised 26 March, 2012

### Location and Purpose

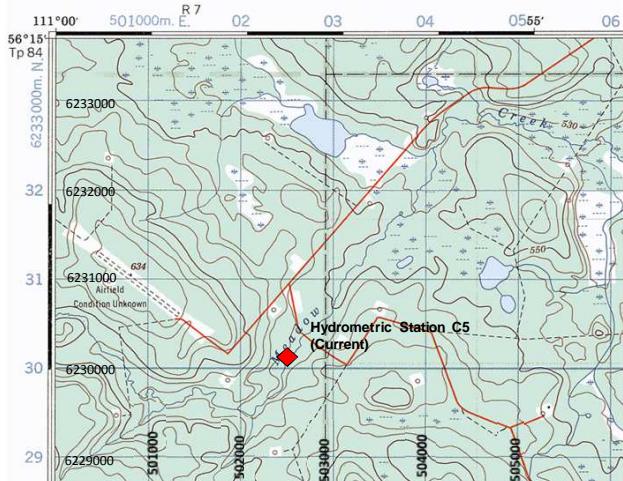

Established in October 2011 to monitor climate conditions between Fort McMurray and Christina Lake.

<b>Variables Measured:</b>	Air Temperature, Relative Humidity, Wind Speed, Wind Direction, Snow Depth, Precipitation, Solar Radiation, and Barometric Pressure
<b>Period of Record:</b>	October 2011 to present
<b>Access:</b>	Truck via Hwy 881 and Surmount Project
<b>Coordinates:</b>	502542 E, 6230964 N (NAD 83)
<b>Station Elevation:</b>	Estimated Geodetic Elevation 555 m ± 5m

**Active:** Year Round

**Lat/Long:** 56°13'24" N, 110°57'32" W

**NTS Map:** 74D02

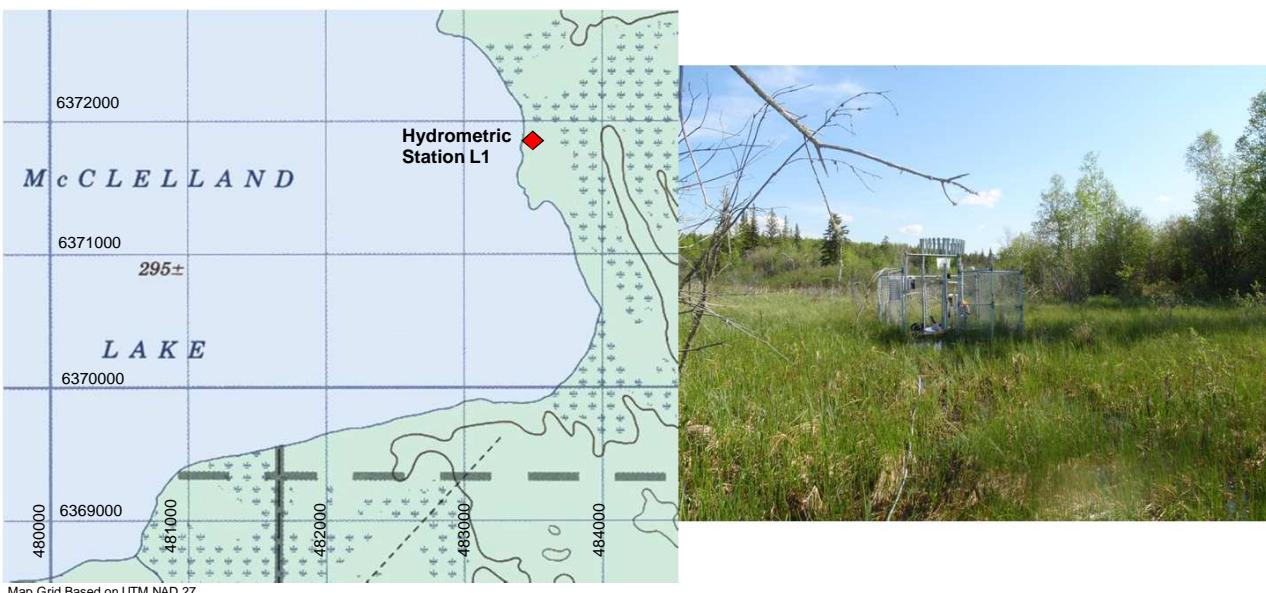

Revised 8 March, 2012

### Location and Purpose:

Established on the East side of McClelland Lake to monitor Water Levels.

**Variables Measured:** Water Level, Precipitation, Air Temperature, Relative Humidity, and Water Temperature  
**Period of Record:** July 1997 to Present  
**Access:** Helicopter  
**Drainage Area:** 191 km<sup>2</sup>  
**Coordinates:** 483430 E, 6371950 N

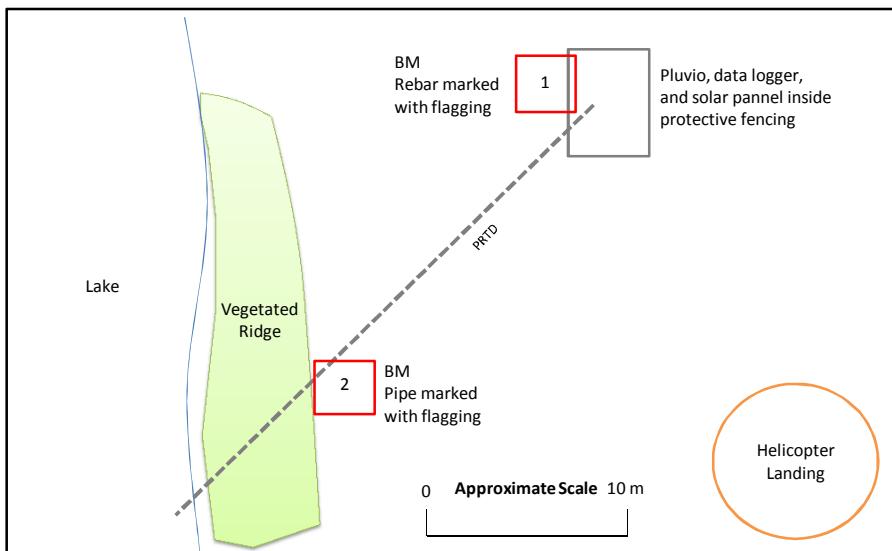

**Active:** Year Round  
**Lat/Long:** 57°29'30" N, 111°16'37" W  
**NTS Map:** 74E06  
**ATS:** NW-12-98-9-W4

### Benchmarks:

**BM:** 1  
**Elevation:** 294.731 m  
**Basis:** Level survey from BM2  
**Location:** Next to fence towards lake  
**Description:** Iron rod, 0.4 m out of ground

**BM:** 2  
**Elevation:** 294.865 m  
**Basis:** Assumed  
**Location:** 2m towards fencing from old station mast  
**Description:** Steel pipe, 0.4 m out of water

Benchmark Notes: Approximate geodetic elevation of Benchmark 1 based on 2011 differential GPS program 294.5 ±0.5m

Revised 8 March, 2012

### Location and Purpose

Established to monitor water levels in Kearl Lake.

**Variable Measured:** Water Level, Precipitation, Water Temperature, Air Temperature, and Relative Humidity

**Period of Record:** May 1999 to Present

**Active:** Year Round

**Access:** 2WD Access via Canterra Road

**Lat/Long:** 57°18' 8.3" N, 111 °15' 5.8" W

**Drainage Area:** 72.6 km<sup>2</sup>

**NTS Map:** 74E06

**Coordinates:** 484839 E, 6351065 N (UTM NAD 83)

**ATS:** 4-16-96-11-W4

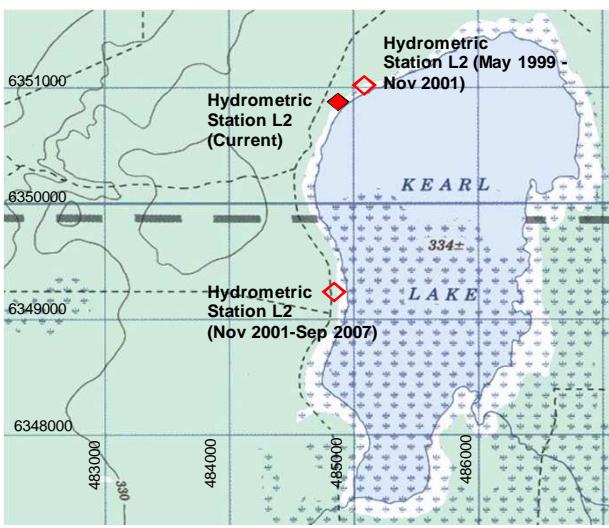

### Previous Locations:

**Period:** May 1999 to November 2001

**Coordinates:** 485184 E, 6351267 N (UTM NAD 83)

**Period:** November 2001 to September 2007

**Coordinates:** 484935 E, 6349023 N (UTM NAD 83)

### Benchmarks

**BM:** 1

**BM:** 2

**Elevation:** 333.058 m

**Elevation:** 332.424

**Basis:** Level survey from BM2

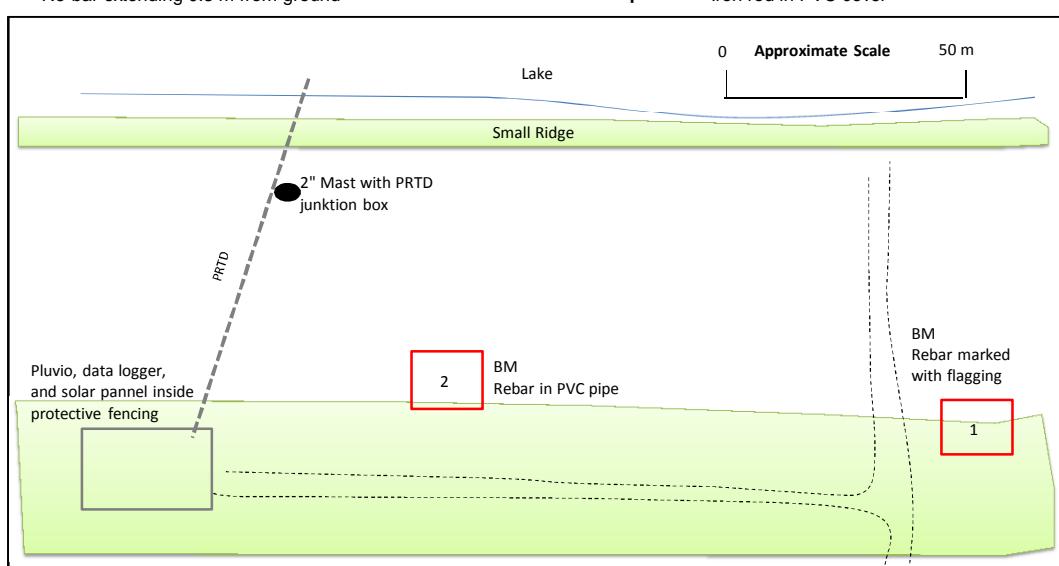

**Basis:** GPS Survey ± 13 mm referenced to Kearl Project

**Location:** 3 m south of trail at edge of tree line.

**Location:** 20 m South of logger at edge of tree line

**Description:** Re-bar extending 0.3 m from ground

**Description:** Iron rod in PVC cover

Benchmark Notes: Approximate geodetic elevation of Benchmark 2 based on 2011 differential GPS program 332 ± 0.5m

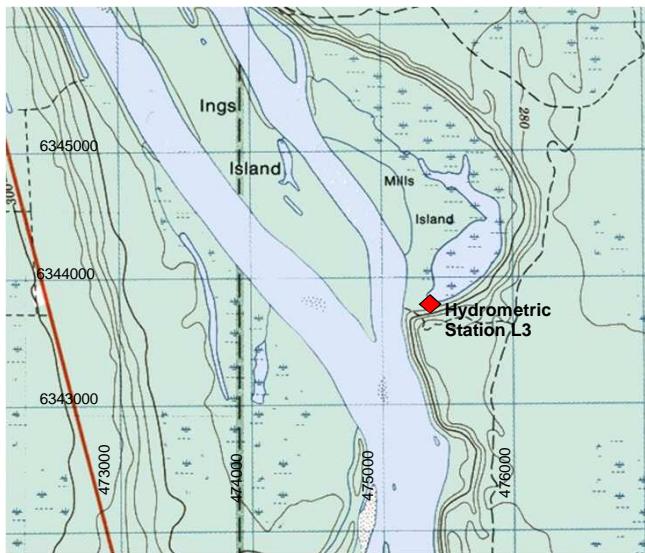

Revised 8 March, 2012

**Location and Purpose:**

Established to monitor water levels in Isadore's Lake.

**Variable Measured:** Water Level, Water Temperature  
**Period of Record:** February 2000 to Present  
**Access:** 4WD road access off Highway 63  
**Drainage Area:** 28.0 km<sup>2</sup>  
**Coordinates:** 463305 E, 6342967 N (UTM NAD 83)

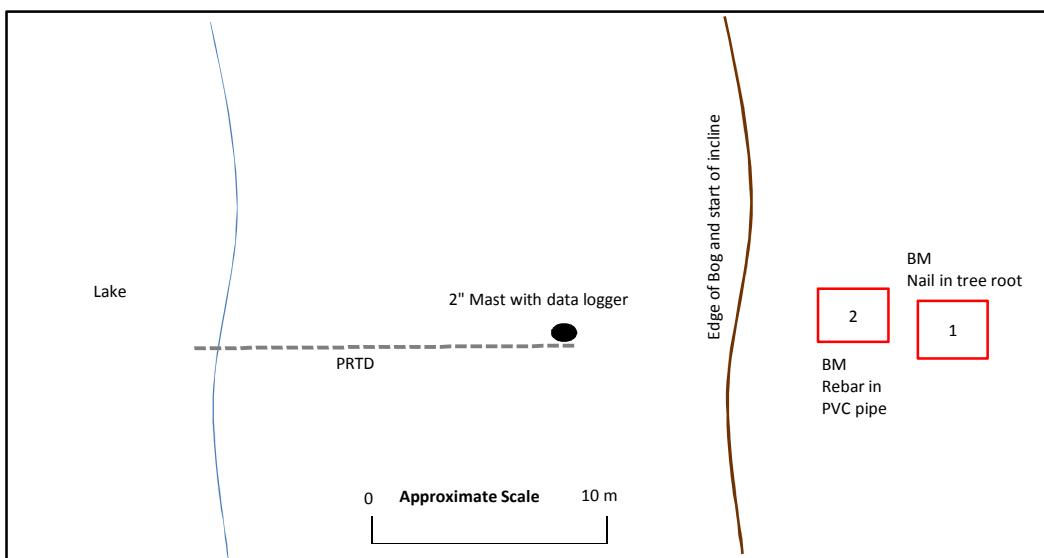

**Active:** Year Round  
**Lat/Long:** 57°13'42.6" N, 111°36'28.5" W  
**NTS Map:** 74E04  
**LSD:** 16-7-95-10-W4

**Benchmarks**

**BM:** 1  
**Elevation:** 235.901 m  
**Basis:** Level survey from BM2  
**Location:** 35 m south of data logger box  
**Description:** Nail in root of spruce tree upslope of lake, nail is flagged with orange tape

**BM:** 2  
**Elevation:** 234.506 m  
**Basis:** Assumed  
**Location:** 30 m south of data logger box  
**Description:** Rebar in PVC Pipe  
 BM #1 and data logger box

Benchmark Notes: Approximate geodetic elevation of Benchmark 2 based on 2011 differential GPS program 234 ± 0.5m

Revised 6 March, 2012

**Location and Purpose:**

Established to monitor discharge on Jackpine Creek upstream of the Muskeg River. Replaced an Environment Canada hydrometric station (07DA009) that previously operated at the original site from 1975 to 1993. Station was moved to present location in 2000 to allow road access and avoid beaver dams.

**Variable Measured:** Water Level, Discharge, and water temperature

**Period of Record:** May 1995 to Present

**Access:** 2WD Access on Canterra Rd.

**Drainage Area:** 358 km<sup>2</sup>

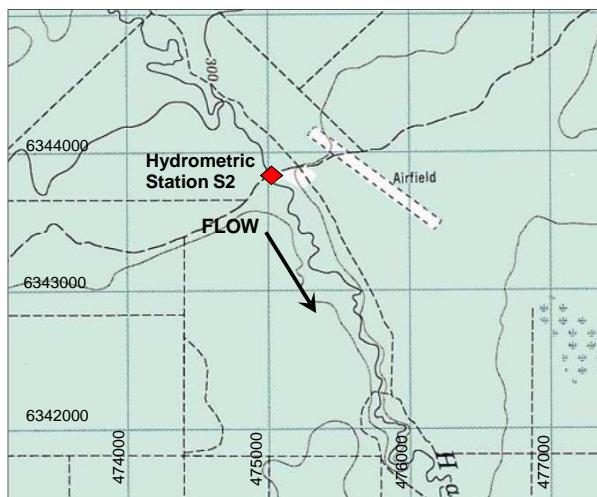

**Coordinates:** 474961 E, 6344087 N (UTM NAD 83)

**Active:** Year Round

**Lat/Long:** 57°14'21" N, 111°24'53" W

**NTS Map:** 74E / 3

**LSD:** SE-17-95-9-W4

Map Grid Based on UTM NAD 27

**Benchmarks**

**BM:** 1

**Elevation:** 297.990 m

**Basis:** survey date unknown

**Location:** 5 m South of data logger

**Description:** Rebar in white PVC pipe on right bank just upstream of the logger box

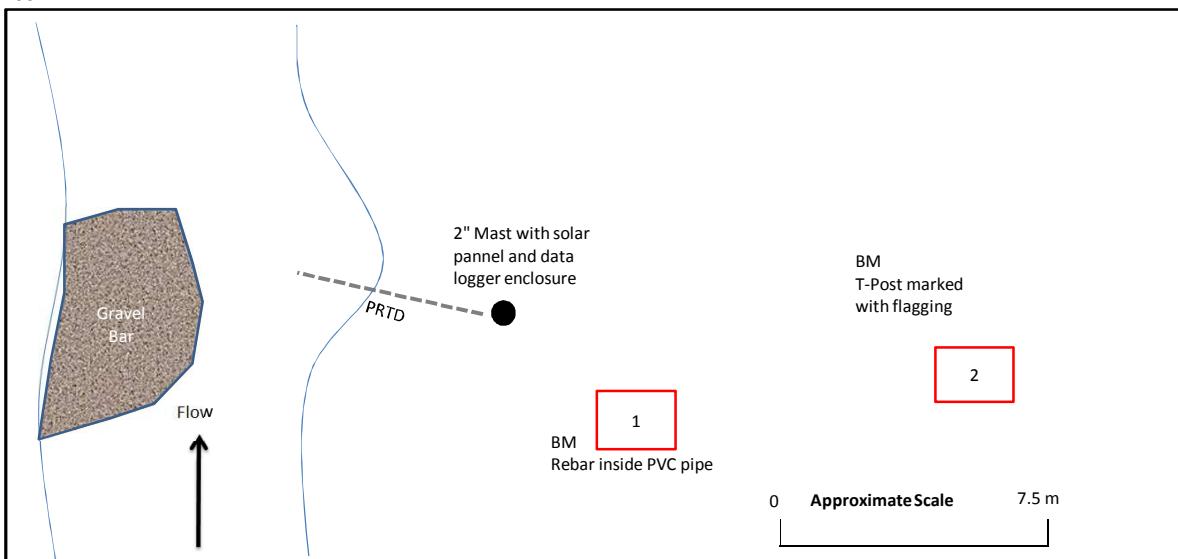

**BM:** 2

**Elevation:** 298.161 m

**Basis:** Level Survey from BM 1

**Location:** 6 m SE of data logger

**Description:** T-Post marked with pink flagging

Benchmark Notes: Approximate geodetic elevation of Benchmark Benchmark 2 based on 2011 differential GPS program 297.5 ± 0.5m

Updated 6 March, 2012

**Location and Purpose:**

Established to monitor discharge on Iyinimin Creek upstream of Kearn Lake. This station is intended to characterize runoff from the North / West slopes of Muskeg Mountain and provide input to Kearn Lake water balance calculations. A rain gauge was added to the station in 1998.

**Variables Measured:** Water Level, Discharge, Water Temperature, and Rainfall

**Period of Record:** May 1995 to October 1999; May 2001 to Present

**Active:** Open Water Season

**Access:** Helicopter

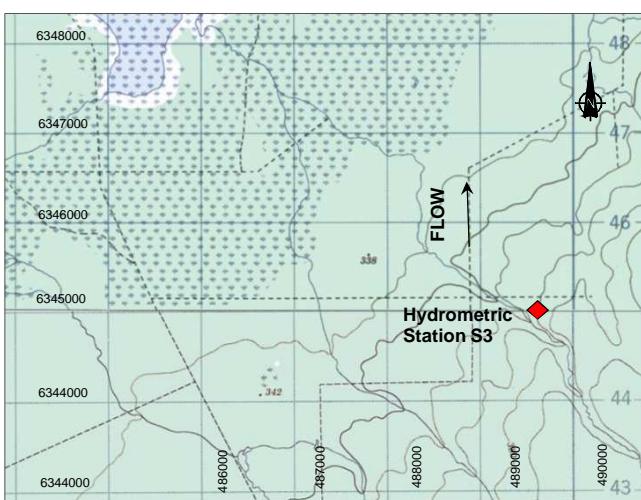

**Lat/Long:** 57°15' 00 " N, 111°10' 0

**Drainage Area:** 32.2 km<sup>2</sup>

**NTS Map:** 74E06

**Coordinates:** 489491 E, 6345029 N (UTM NAD 83)

**LSD:** NE-14-95-8-W4

Map Grid Based on UTM NAD 27

**Benchmarks:**

**BM:** 2

**BM:** 3

**Elevation:** 360.514m

**Elevation:** 361.385m

**Basis:** Unknown

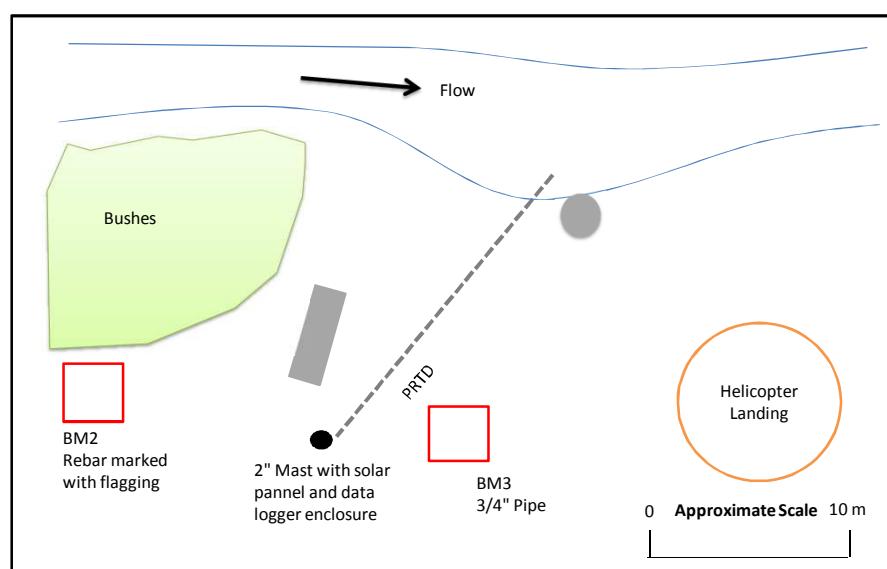

**Basis:** Level survey from BM2

**Location:** 8m west of data logger

**Location:** 3m east of data logger station

**Description:** Re-bar marked with pink flagging

**Description:** 3/4" Pipe

Benchmark Notes: Approximate geodetic elevation of Benchmark 3 based on 2011 differential GPS program  $361.5 \pm 0.5\text{m}$

Revised 6 March, 2012

**Location and Purpose:**

Established originally in 1995 to monitor discharge on the Muskeg River above disturbed watersheds. Decommissioned in 1996, station was re-activated in 2003 in accordance with regulatory monitoring.

**Variable Measured:** Water Level, Discharge, and Water Temperature

**Period of Record:** Aug 1995 to Dec 1996; Feb 2003 to Present

**Access:** Helicopter

**Drainage Area:** 395 km<sup>2</sup>

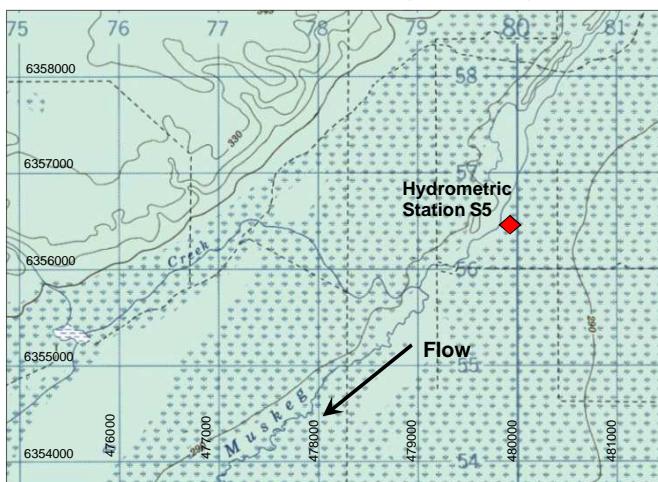

**Coordinates:** 479760 E, 6356755 N (UTM NAD 83)

**Active:** Year Round

**Lat/Long:** 57°21'11" N, 111°20'10" W

**NTS Map:** 74E06

**LSD:** SE-26-96-9-W4

Map Grid Based on UTM NAD 27

**Benchmarks**

**BM:** 1

**Elevation:** 98.346 m

**Basis:** Level survey from BM2

**Location:** 3 metres downstream of stilling well

**Description:** T-post 0.4 m from surface

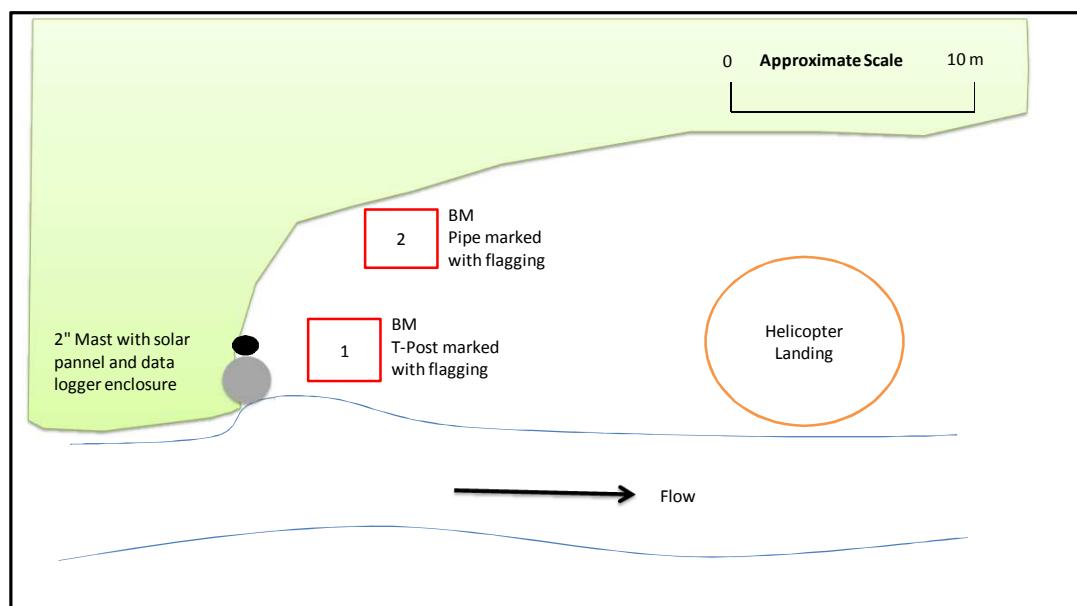

**BM:** 2

**Elevation:** 98.369 m

**Basis:** assumed

**Location:** 6 metres south of stilling well under bushes

**Description:** pipe 0.4 m from surface marked with pink flag

Benchmark Notes: Approximate geodetic elevation of Benchmark 1 based on 2011 differential GPS program 285.5±0.5m

Revised 6 March, 2012

## Station Factsheet

### Location and Purpose:

Established to monitor discharge on the Muskeg River upstream of disturbed watersheds. The station was relocated in 1998 to allow road access.

**Variable Measured:** Water Level, Discharge, Barometric Pressure, and Water Temperature

**Period of Record:** Aug 1995 to Present

**Access:**

2WD road via the Syncrude Aurora North Mine

**Drainage Area:**

552 km<sup>2</sup> (was 390 km<sup>2</sup> until 1998)

**Coordinates:**

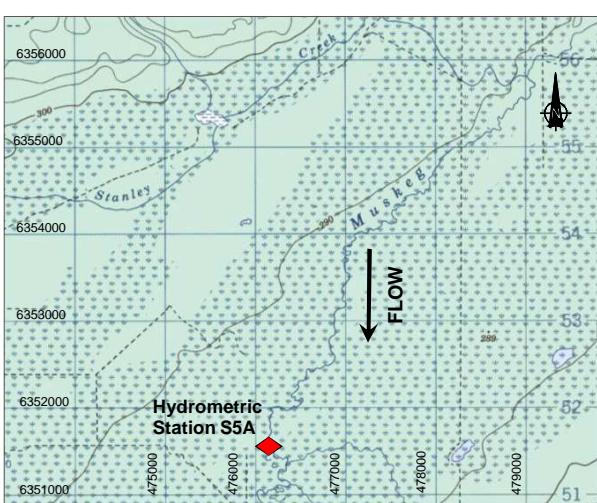

476100 E, 6351600 N (UTM NAD 83)

**Active:** Year Round

**Lat/Long:** 57°18'30" N, 111°23'43" W

**NTS Map:** 74E06

**LSD:** SE-9-96-9-W4

### Benchmarks:

**BM:** 1

**Elevation:** 282.676 m

**Basis:** Level survey from BM2

**Location:** 6 m east of data logger

**Description:** T-Post near data logger marked with orange flagging

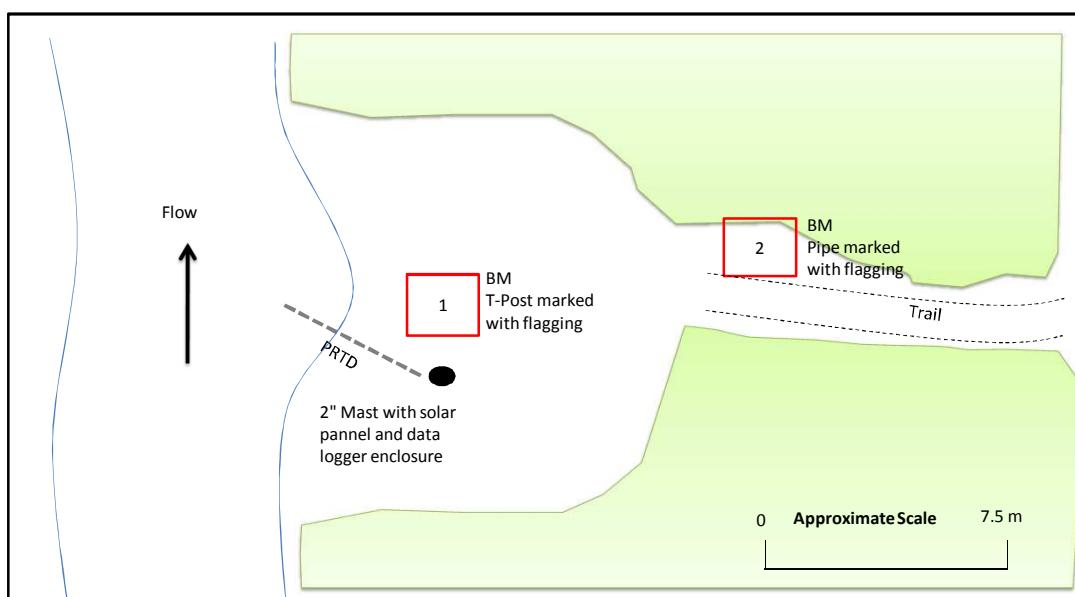

**BM:** 2

**Elevation:** 282.159 m

**Basis:** survey date unknown

**Location:** 2 m past edge of willow to south of path

**Description:** pipe driven to 0.4 m of ground

Benchmark Notes: Approximate geodetic elevation of Benchmark 1 based on 2011 differential GPS program 283±0.5m

Revised 6 March, 2012

**Location and Purpose:**

Established to monitor discharge on Mills Creek, downstream of the Mills Creek fen and upstream of Isadore's Lake. The original plywood and timber pile V-notch weir was replaced with steel piles and sheet steel weir in October 2005.

**Variable Measured:** Water level, discharge, and water temperature

**Period of Record:** May 1997 to Present

**Access:** 2WD road access along Highway 63 (paved)

**Drainage Area:** 9 km<sup>2</sup>

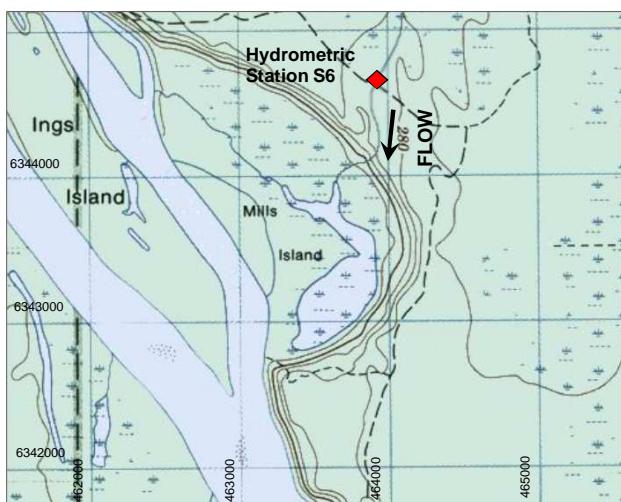

**Coordinates:** 463829 E, 6344743 N (UTM NAD 83)

**Active:** Year Round

**Lat/Long:** 57°14'44" N, 111°35'57" W

**NTS Map:** 74E04

**LSD:** NW-17-95-10-W4

Map Grid Based on UTM NAD 27

**Benchmarks: BM1**

**Elevation:** 273.600 m

**Basis:** survey date unknown

**Location:** 7 m north west of data logger

**Description:** Rebar in white PVC pipe just uphill (in gully) from the data logger

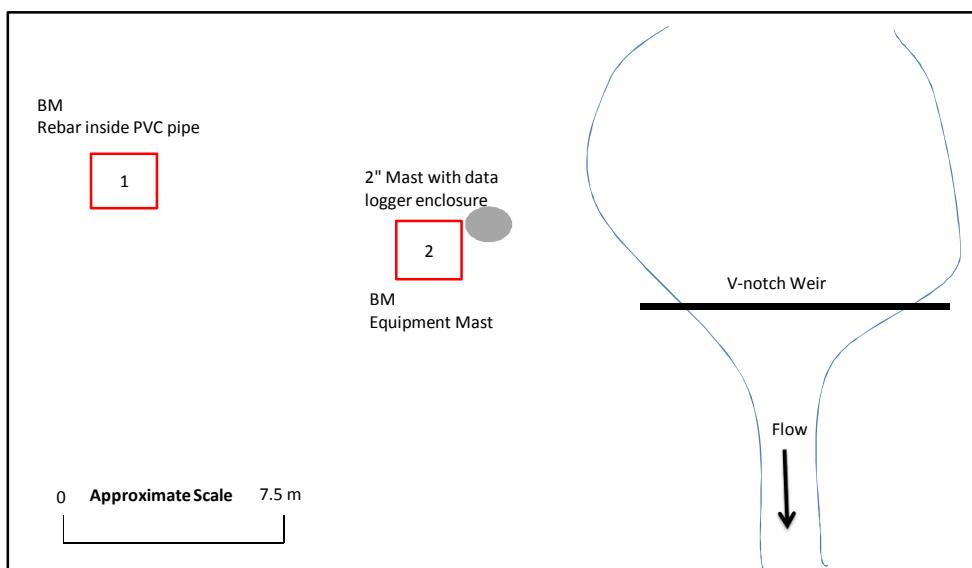

**BM2**

**Elevation:** 274.139 m

**Basis:** Level survey from BM1

**Location:** At the equipment mast itself

**Description:** top of equipment mast or steel pipe on which the logger box is mounted, beside the stilling well

Benchmark Notes: Approximate geodetic elevation of Benchmark 1 based on 2011 differential GPS program  $273.5 \pm 0.5$ m

**Climate and Hydrology**

Revised 6 March, 2012

**Location and Purpose:**

Established to monitor winter discharge on the Muskeg River at the Environment Canada hydrometric station 07DA008. The Environment Canada hydrometric station has operated since 1975 but discharges are only published for the March–October period.

**Variable Measured:** Water level, discharge, and water temperature

**Period of Record:** October 1999 to Present

**Access:** 2WD access off of Canterra Road (gravel)

**Drainage Area:** 1457 km<sup>2</sup>

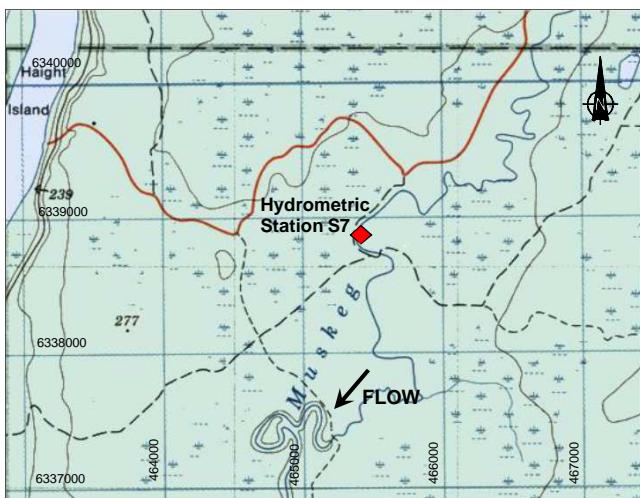

**Coordinates:** 465408 E, 6338944 N (UTM NAD 83)

**Active:** Year Round

**Lat/Long:** 57°11'32" N, 111°34'21" W

**NTS Map:** 74E04

**LSD:** SE-32-94-10-W4

Map Grid Based on UTM NAD 27

**Benchmarks:**

**Elevation:** 275.549 m

**Basis:** Level survey from BM2

**Location:** 25 m west of data logger

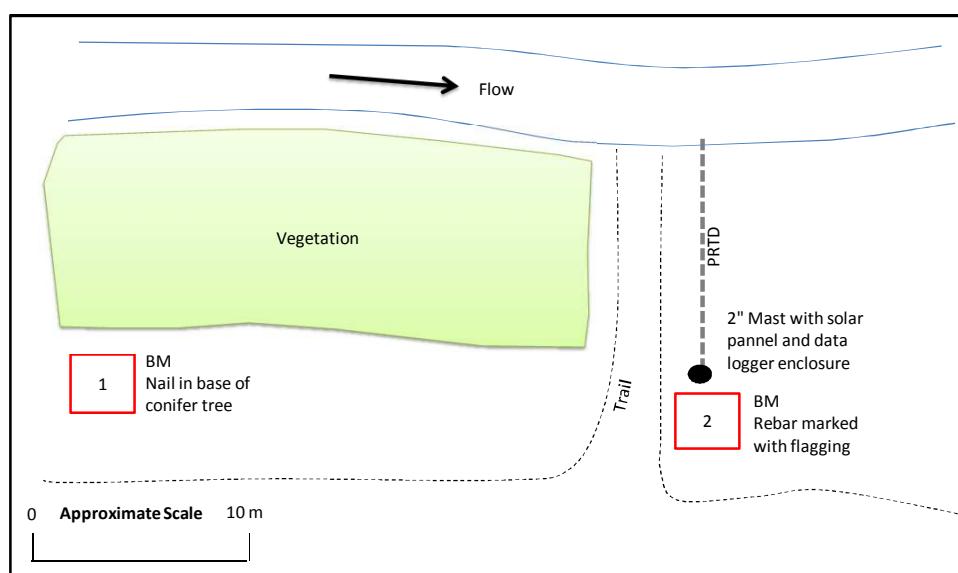

**Description:** Nail in tree ~ 3 m north of road and ~ 25 m west of data logger box

**Elevation:** 275.406 m

**Basis:** Assumed

**Location:** ~2 m SW of data logger box

**Description:** Rebar in black PVC with orange cap

Benchmark Notes: Approximate geodetic elevation of Benchmark 3 based on 2011 differential GPS program 275±0.5m

### Climate and Hydrology

Revised 6 March, 2012

#### Location and Purpose:

Established to monitor discharge on the Kearl Lake Outlet channel to provide data for the Kearl Lake water balance and to assess the effects of development on the lake. The station was relocated approximately 50 m downstream in November 2005 to avoid the influence of beaver dams. The station was located just upstream of a road culvert crossing before the move and is currently of the crossing.

**Variable Measured:** Water level, discharge, and water temperature

**Period of Record:** May 2000 - Oct. 2002; April 2006 - Present

**Access:** 4WD road access

**Drainage Area:** 73.6 km<sup>2</sup>

**Coordinates:** 483962 E, 6346990 N (UTM NAD 83)

**Active:** Year Round, data logger installed in open water season only

**Lat/Long:** 57°15'56.38" N, 111°15'57.27" W

**NTS Map:** 74E06

**LSD:** SE-29-95-8-W4

Map Grid Based on UTM NAD 27

#### Benchmarks:

##### BM : 1

**Elevation:** 329.796 m

**Basis:** Geodetic

**Location:** Birch tree 6 m North of data logger enclosure

**Description:** Nail in base of Birch tree

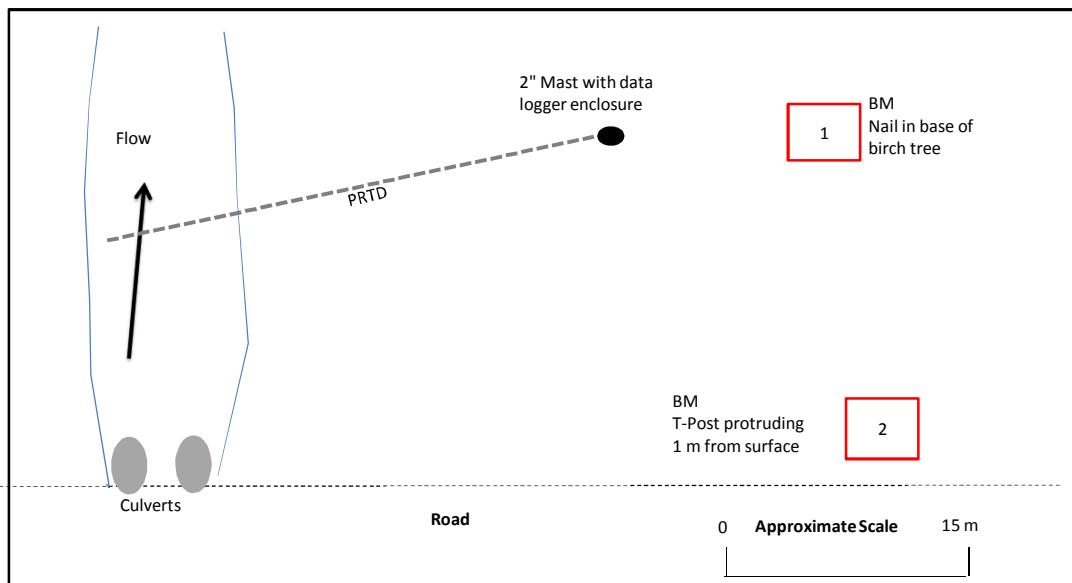

##### BM : 2

**Elevation:** 331.024 m

**Basis:** Level survey from BM1

**Location:** 6 m West of road towards data logger encl

**Description:** T-Post protruding 0.75 m from ground

Benchmark Notes: Approximate geodetic elevation of Benchmark 2 based on 2011 differential GPS program 331±0.5m

**Climate and Hydrology**

Revised 6 March, 2012

**Location and Purpose:**

Established to monitor discharge on the Wapasu Creek upstream of the Muskeg River. Extensive beaver activity since 2009 has flooded most of the area.

**Variable Measured:** Water level, discharge, and water temperature

**Period of Record:** March 1998 - Oct. 1999; May 2001 - Present

**Access:** 4WD road access on Canterra Rd.

**Drainage Area:** 90.7 km<sup>2</sup>

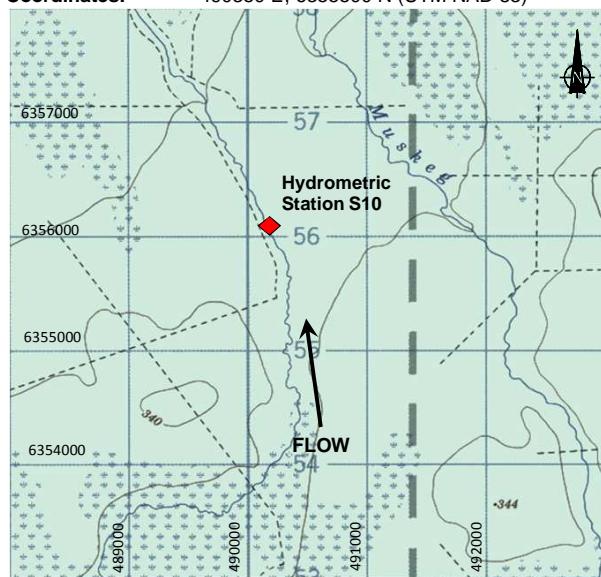

**Coordinates:** 490350 E, 6355500 N (UTM NAD 83)

**Active:** Year Round

**Lat/Long:** 57°20'35" N, 111°09'40" W

**NTS Map:** 74E06

**LSD:** NW-24-96-8-W4

**Benchmarks:**

**BM : 1**

**Elevation:** 100.585 m

**Basis:** Assumed

**Location:** Large tree 6 m North of data logger enclosure

**Description:** Nail in base of tree

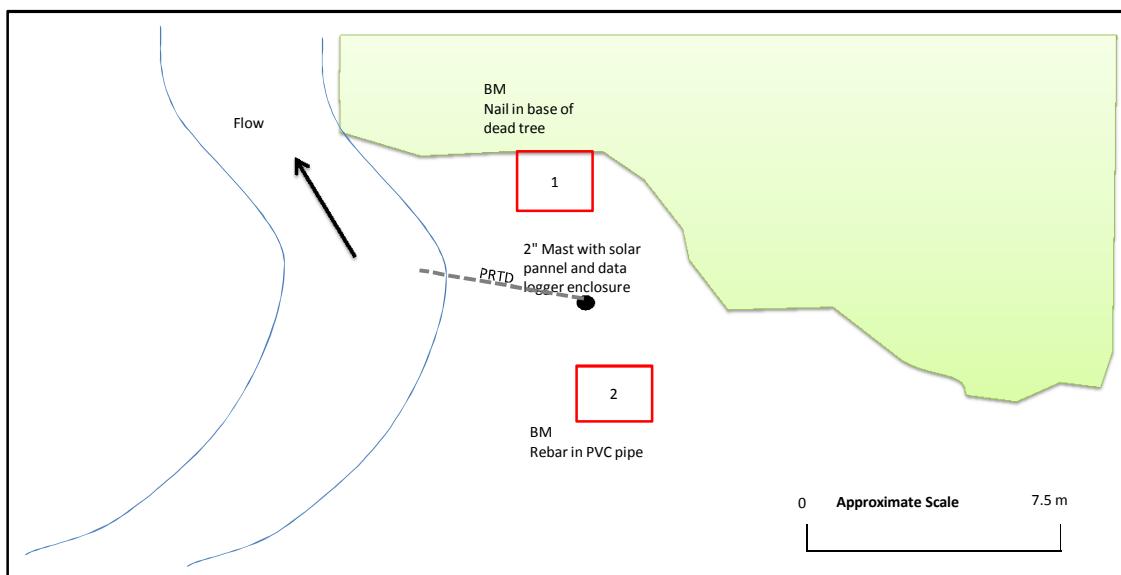

**BM : 2**

**Elevation:** 100.657 m

**Basis:** Assumed

**Location:** 4 m South of data logger enclosure

**Description:** Rebar in PVC Pipe

Benchmark Notes: Approximate geodetic elevation of Benchmark 1 based on 2011 differential GPS program 320±0.5m

Revised 6 March, 2012

**Location and Purpose:**

Established to monitor discharge on Poplar Creek upstream of the Athabasca River. The station is at the site of Environment Canada hydrometric station (07DA007) that operated from 1973 to 1986.

**Variable Measured:** Water level, discharge, and water temperature

**Period of Record:** May 1997 to Present

**Active:** Year Round, data logger installed in open water season only

**Access:** 2WD access on Hwy 63 (paved)

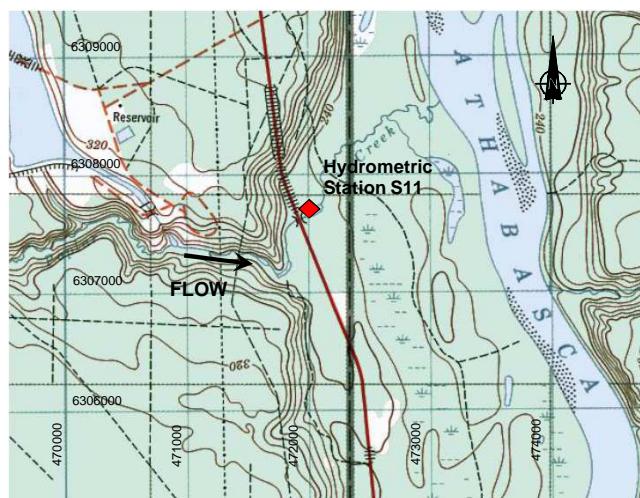

**Lat/Long:** 56°54'46" N, 111°27'44" W

**Drainage Area:** 151 km<sup>2</sup>

**NTS Map:** 74D14

**Coordinates:** 472000 E, 6307650 N (UTM NAD 83)

**LSD:** NE-24-91-19-W4

**Benchmarks:**

**BM: 1**

**BM: 2**

**Elevation:** 242.095 m

**Elevation:** 242.382 m

**Basis:** Level survey from BM2

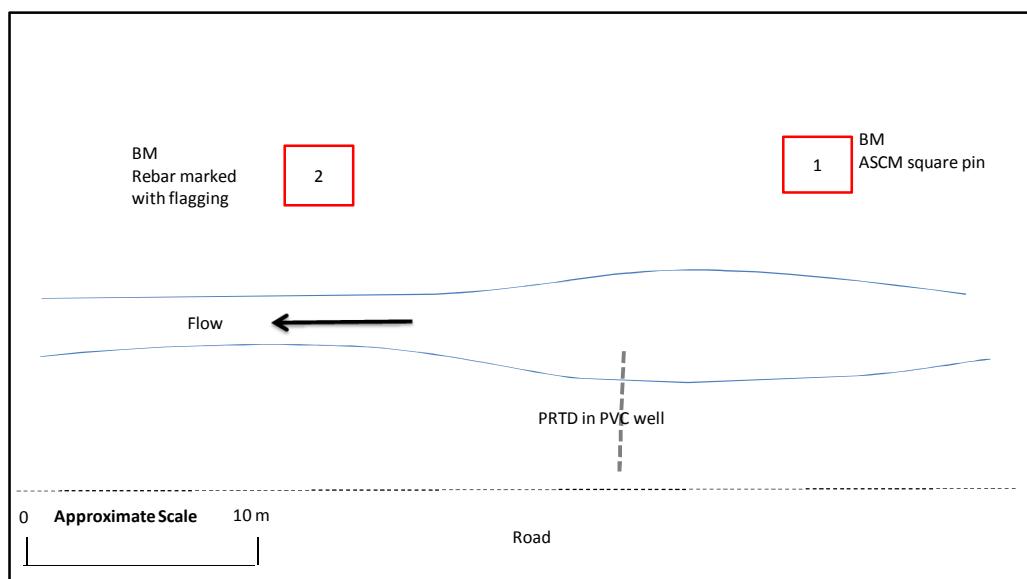

**Basis:** Geodetic

**Location:** On river right, 15 m upstream from the logger

**Location:** On river right 25 m downstream of ASCM Monument

**Description:** ASCM marker, square pin next to orange stake

**Description:** Rebar protruding 0.3m from ground surface

Benchmark Notes: Approximate geodetic elevation of Benchmark 2 based on 2011 differential GPS program 242.5±0.5m

**Climate and Hydrology**

Revised 6 March, 2012

**Location and Purpose:**

Established in May 2000 to monitor discharge on Fort Creek upstream of the Athabasca River and was discontinued in 2002. The station was reactivated in 2006 to monitor streamflow downstream of the Fort Hills development. In August 2009 the station was moved 50 m downstream due to road construction.

**Variable Measured:** Water level, discharge, and water temperature

**Period of Record:** May 2000 - Oct. 2002; April 2006 - Present

**Access:** 2WD road access via Hwy 63 extension

**Drainage Area:** 32 km<sup>2</sup>

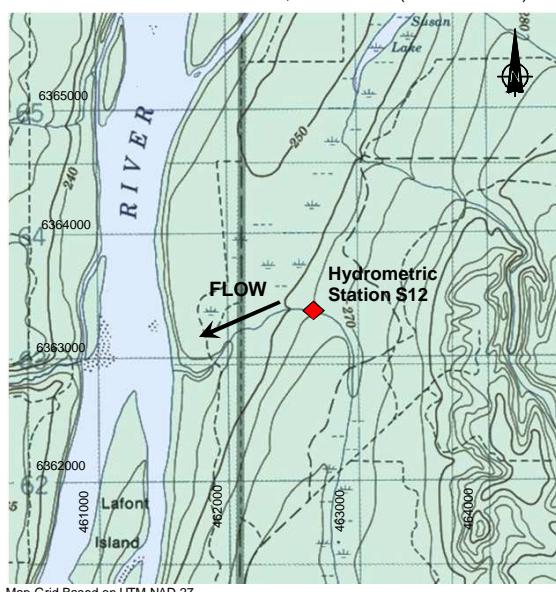

**Coordinates:** 462600 E, 6363400 N (UTM NAD 83)

**Active:** Open Water Season

**Lat/Long:** 57°24'48" N, 111°37'18" W

**NTS Map:** 74E05

**LSD:** SW-18-97-10-W4

**Benchmarks:**

**BM : 1**

**Elevation:** 98.699 m

**Basis:** Assumed

**Location:** 5 m upstream of data logger on left bank

**Description:** T-Post protruding 0.3 m from ground

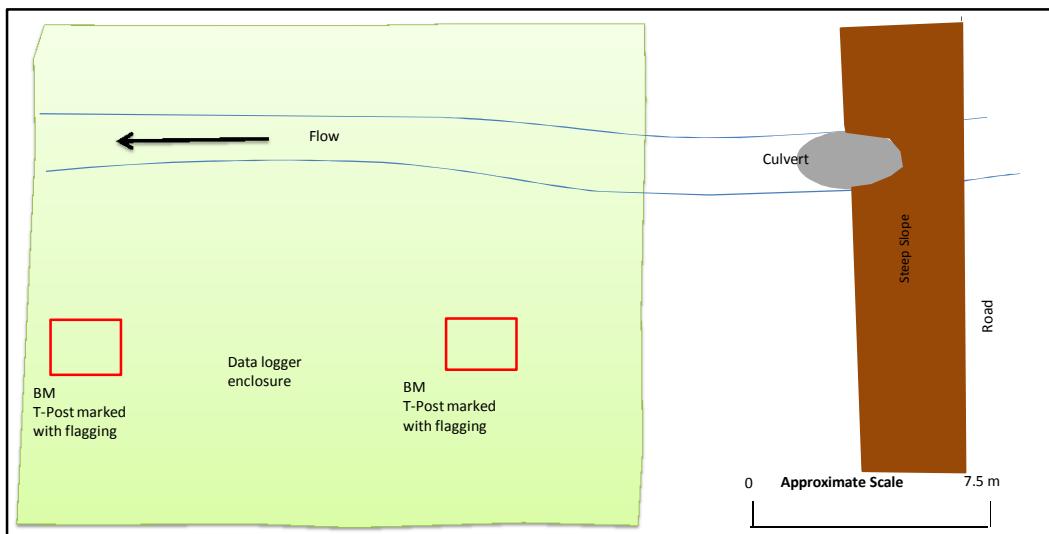

**BM : 2**

**Elevation:** 98.470 m

**Basis:** Level survey from BM1

**Location:** 5 m downstream of data logger on left bank

**Description:** T-Post protruding 0.3 m from ground

Benchmark Notes: Approximate geodetic elevation of Benchmark 1 based on 2011 differential GPS program 252.5±0.5m

Revised 6 March, 2012

### Location and Purpose

Established in October 2004 to monitor discharge on the Ells River. This station replaced station S14.

**Variable Measured:** Water level, discharge, and water temperature

**Period of Record:** October 2004 to present

**Access:** 2WD Road Access

**Drainage Area:** 2450 km<sup>2</sup>

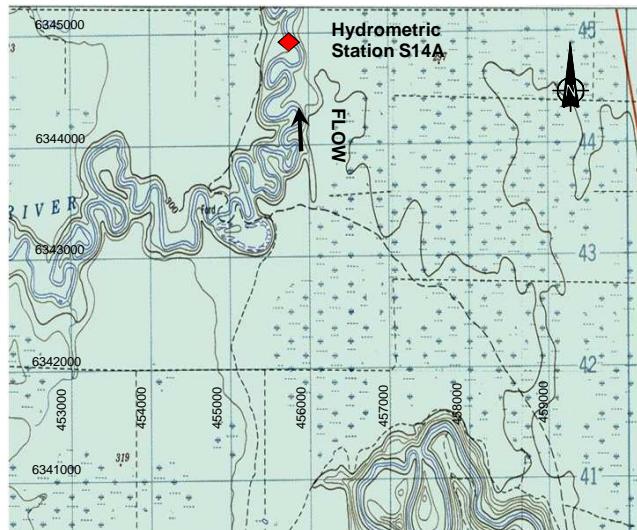

**Coordinates:** 455748 E, 6344947 N (UTM NAD 83)

**Active:** Year Round

**Lat/Long:** 57°14'44" N, 111°43'56" W

**NTS Map:** 74E04

**ATS:** NW-16-95-11-W4

### Benchmarks

**BM:** 1

**Elevation:** 101.930 m

**Basis:** Assumed

**Location:** 8 m north east of data logger box

**Description:** Top of pipe closer to left bank that supports the bubbler system enclosure.

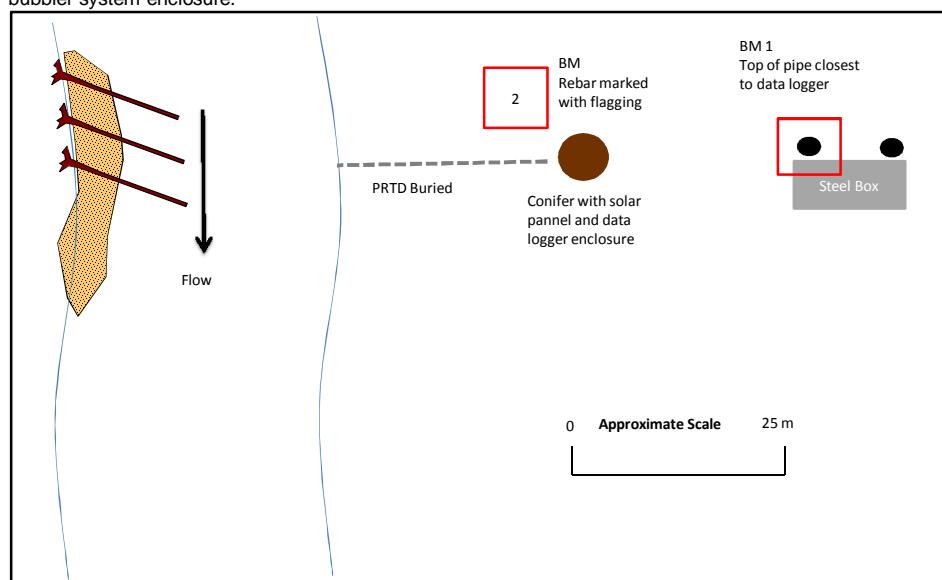

**BM:** 2

**Elevation:** 100.12

**Basis:** Level survey from BM1

**Location:** 3 m to the left of data logger

**Description:** Rebar in ground marked with orange flagging tape

Benchmark Notes: Approximate geodetic elevation of Benchmark 2 based on 2011 differential GPS program 277.5±0.5m

Revised 6 March, 2012

#### Location and Purpose

Established on May 1, 2007 to replace station S15. The purpose of the station is to monitor the discharge on the Tar River below development.

**Variable Measured:** Water Level, Discharge and Water temperature

**Period of Record:** May 1st 2007 to present

**Access:** Truck

**Drainage Area:** 333 km<sup>2</sup>

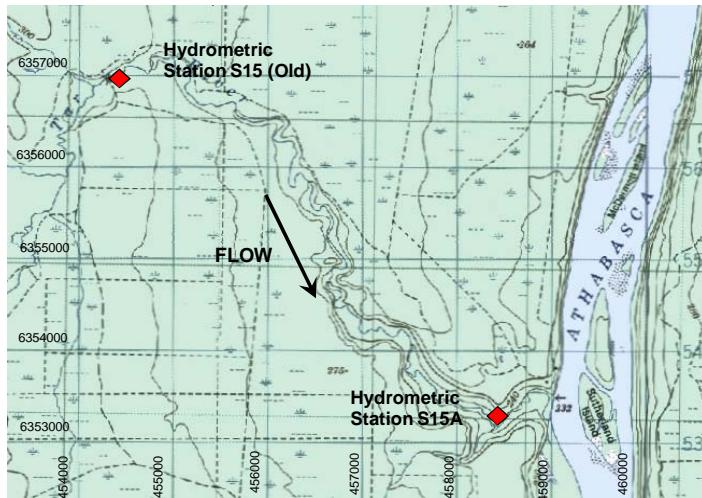

**Coordinates:** 458395 E, 6353391 N (UTM NAD 83)

**Active:** Year Round

**Lat/Long:** 57°19'17.57" N, 111°41'27.08" W

**NTS Map:** 74E05

**ATS:** 16-10-96-11-W4

Map Grid Based on UTM NAD 27

#### Benchmarks

**BM:** 1

**Elevation:** 100.000 m (assumed)

**Basis:** Assumed

**Location:** At base of large log spanning river on RB side

**Description:** Nail in stump with purple flagging.

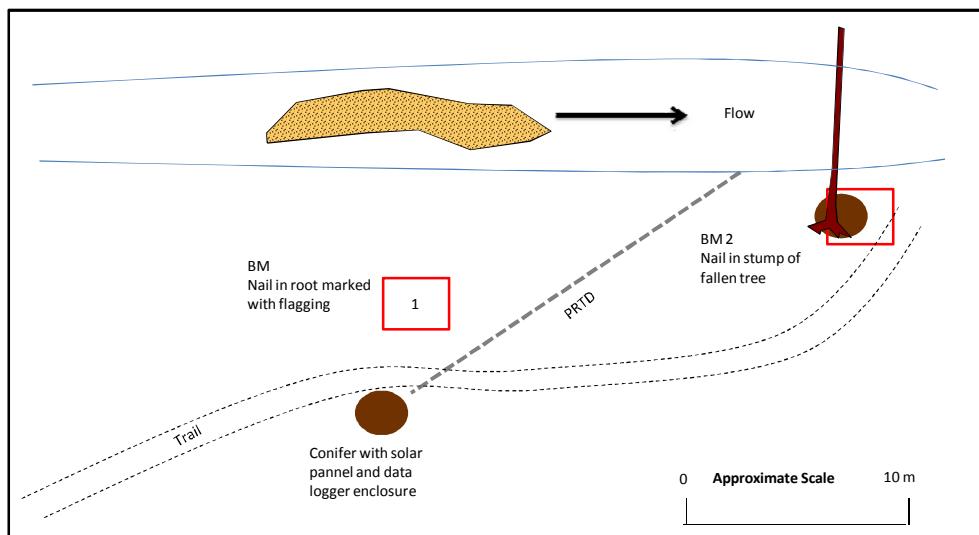

**BM:** 2

**Elevation:** 100.356

**Basis:** Level survey from BM 1

**Location:** 1 metre DS from logger box on tree root

**Description:** Nail in tree root with purple flagging.

Benchmark Notes: Approximate geodetic elevation of Benchmark 2 based on 2011 differential GPS program 233±0.5m

Revised 6 March, 2012

**Location and Purpose:**

Established to monitor discharge on Calumet River near the Mouth. Located approximately 2 km upstream of abandoned Environment Canada hydrometric station (07DA014) from 1975-1977. Station was operated as S16 from 2001 to 2004, CR-1 2005-2009 by CNRL Horizon, and as S16A 2010 - Present.

**Variable Measured:** Discharge

**Period of Record:** May 2001 to Present

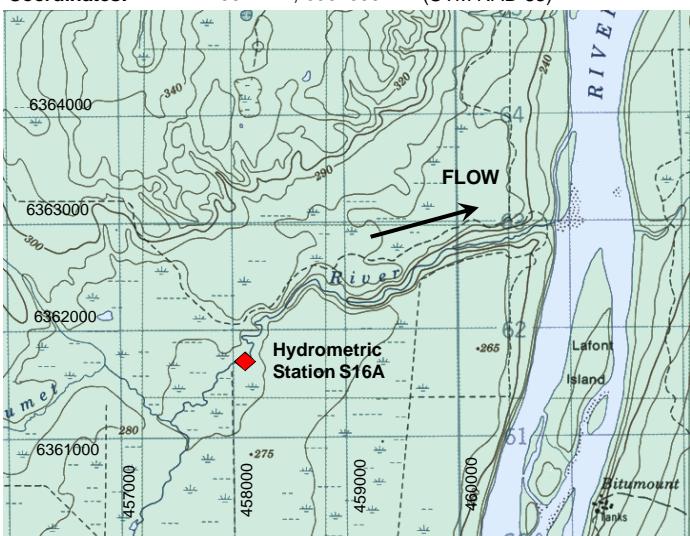

**Access:** Helicopter

**Drainage Area:** 174 km<sup>2</sup>

**Coordinates:** 458147 E, 6361695 N (UTM NAD 83)

**Lat/Long:** 57°23'46" N, 111°41'47" W

**NTS Map:** 74E / 5

Map Grid Based on UTM NAD 27

**Benchmarks**

**BM:** 1

**Elevation:** 99.525 m

**Basis:** Assumed

**Location:** 5 m downstream of tree with logger

**Description:** 3/4" pipe protruding 0.4 m from ground with flagging

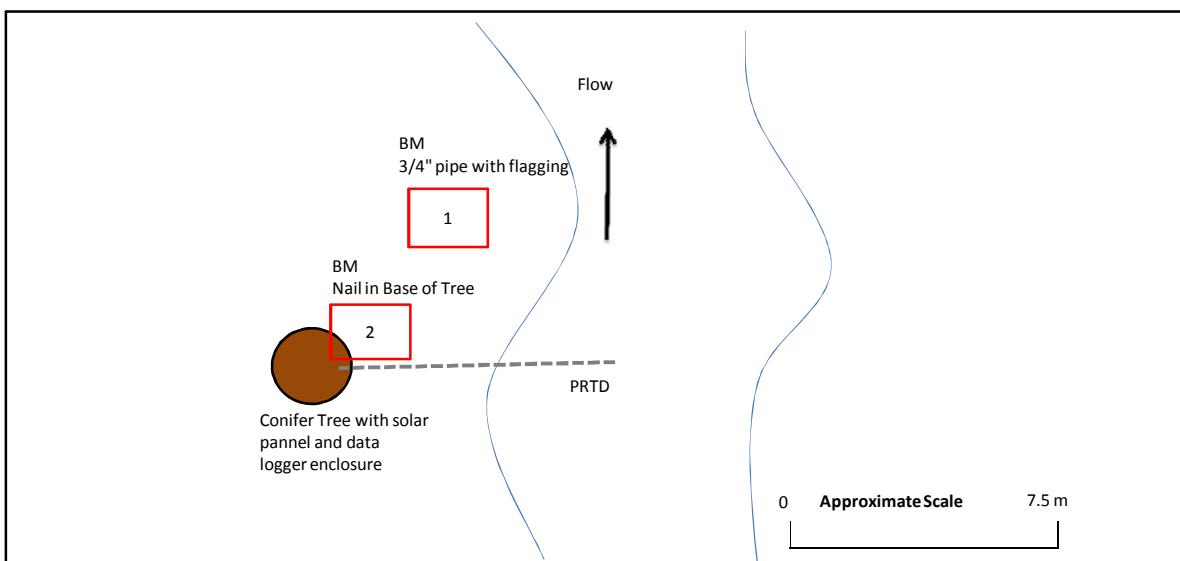

**BM:** 2

**Elevation:** 99.706 m

**Basis:** Level survey from BM1

**Location:** Nail in base of Tree with Logger

**Description:** Nail with flagging in base of tree

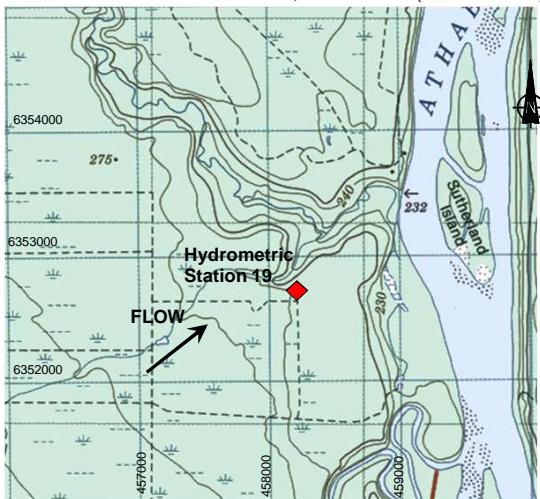

Benchmark Notes: Approximate geodetic elevation of Benchmark 2 based on 2011 differential GPS program 263.5±0.5m

Revised 6 March, 2012

**Location and Purpose:**

Established to monitor discharge and rainfall data adjacent to CNRL mine

**Variable Measured:** Water level, discharge, and rainfall  
**Period of Record:** June 2002 to Present  
**Access:** Truck access via CNRL Horizon Mine  
**Drainage Area:** 11.5 km<sup>2</sup>  
**Coordinates:** 457315 E, 6352863 N (UTM NAD 83)

Map Grid Based on UTM NAD 27

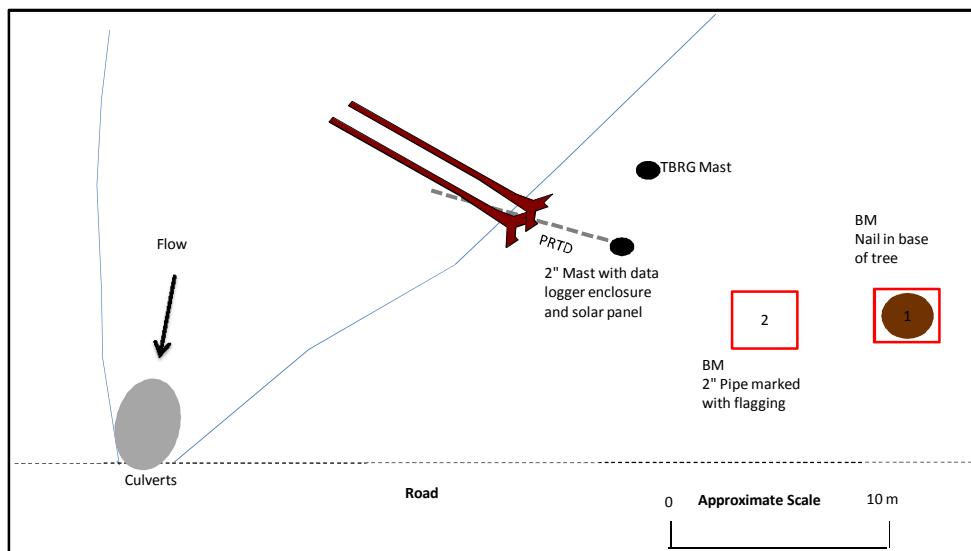

**Active:** Open Water Period

Revised 7 March, 2012

**Location and Purpose:**

Established to monitor discharge on Mackay River at the Petro-Canada Bridge.

**Variable Measured:** Water level, discharge, water temperature, and rainfall

**Period of Record:** January 2008 to Present

**Active:** Year Round

**Access:** Truck

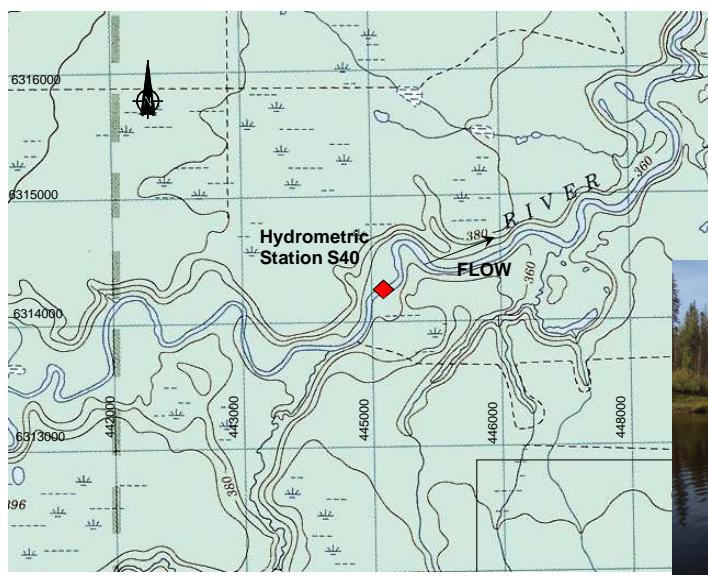

**Lat/Long:** 111°54' 15.33" W, 56°58' 7.01" N

**Drainage Area:** 5290km<sup>2</sup>

**NTS Map:** 74D13

**Coordinates:** 445023 E, 6314256 N (UTM NAD 83)

**ATS:** 12-8-92-12-W4

**BM1**

**Elevation:** 100.000 (Assumed)

**Bases:**

**Location:** On right bank behind data logger enclosure and vegetation

**Description:** 3/4" pipe marked with flagging

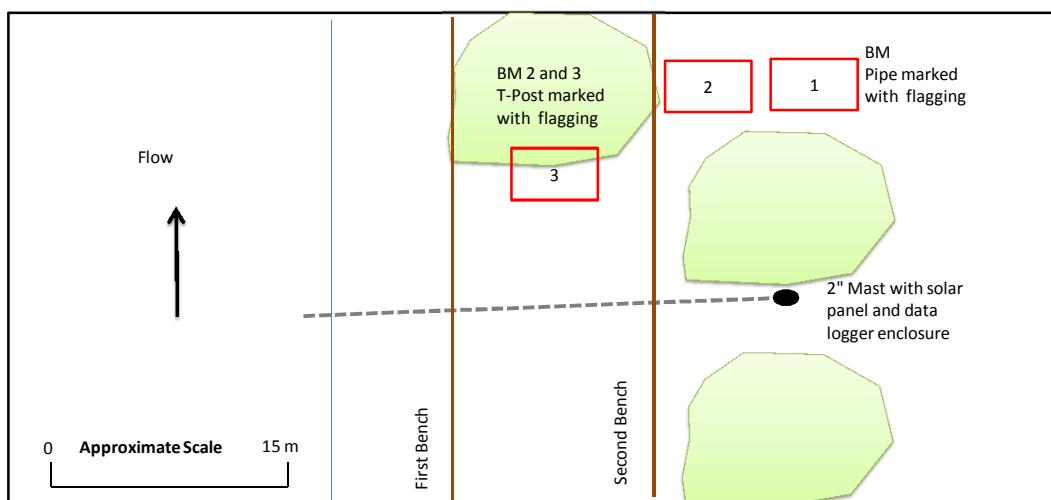

**BM2**

**Elevation:** 97.932 m

**Bases:**

**Location:** On right bank, on second bench to East of BM 1.

**Description:** T-Post sticking approximately 0.25 m out of the ground

Benchmark Notes: Approximate geodetic elevation of Benchmark 1 based on 2011 differential GPS program 357.5±0.5m

Revised 8 March, 2012

#### Location and Purpose:

Water Survey of Canada monitoring site which is monitored by RAMP in the winter period to provide year round monitoring. This site is monitored to estimate values on the Christina River using a mass balance approach for this site and the Clearwater River at Draper site.

**Variable Measured:** Discharge

**Period of Record:** September 1975 RAMP Winter 2008/2009

**Access:** Helicopter

**Drainage Area:** 17,017 km<sup>2</sup>

**Coordinates:** 12 V 504427 E, 6279666 N

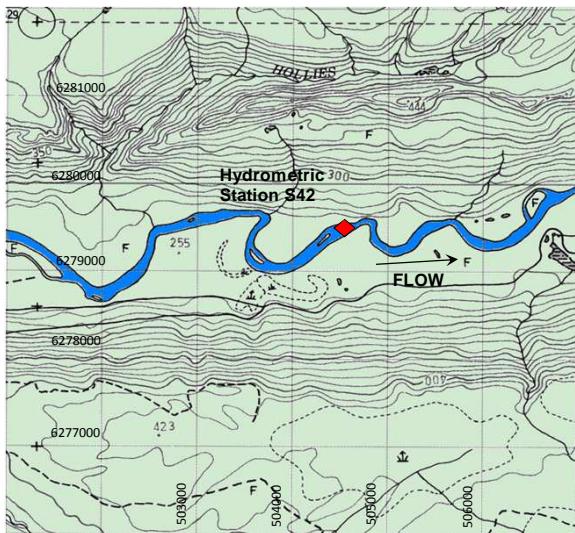

**Active:** WSC March 1 - October 31, RAMP

November 1 - February 28/29

**Lat/Long:** 56°39'40" N, 110°55'40" W

**NTS Map:** 74D10

**LSD:** NW29 6 88W4

Map Grid Based on UTM NAD 27

#### Benchmarks

**BM:** 94-2

**Elevation:** 25.299

**Basis:** unknown

**Location:** Under BM Sign on Right Bank

**Description:** Brass cap on Right Bank

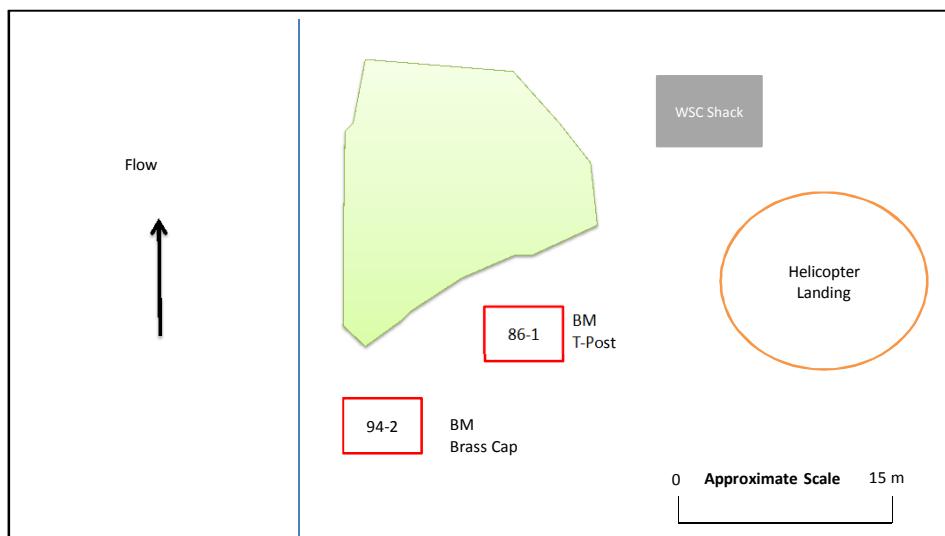

**BM:** 86-1

**Elevation:** 26.749 m

**Basis:** Level survey from BM1

**Location:** Under BM Sign on Right Bank

**Description:** T-Post

Benchmark Notes: No geodetic elevation available for this station

Revised 8 March, 2012

**Location and Purpose:**

Established in May 2009 to monitor discharge on the Firebag River upstream of oil sands operations.

**Variable Measured:** Water level, discharge, water temperature, and rainfall

**Period of Record:** May 2009 to Present

**Access:** Helicopter

**Drainage Area:** 2437 km<sup>2</sup>

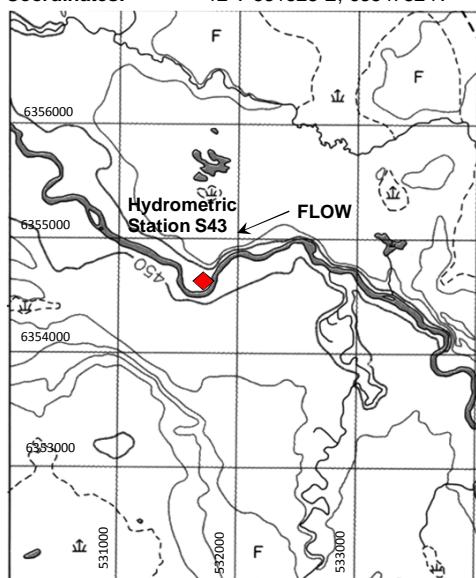

**Coordinates:** 12 V 531528 E, 6354782 N

**Active:** Year around

**Lat/Long:** 57°20'05" N, 110°28'35" W

**NTS Map:** 74E08

**LSD:**

Map Grid Based on UTM NAD 27

**Benchmarks**

**BM 1**

**Elevation:** 100.270 m

**Basis:** Assumed

**Location:** 4 m towards river from station

**Description:** Pipe protruding from ground 0.4 m marked with flagging

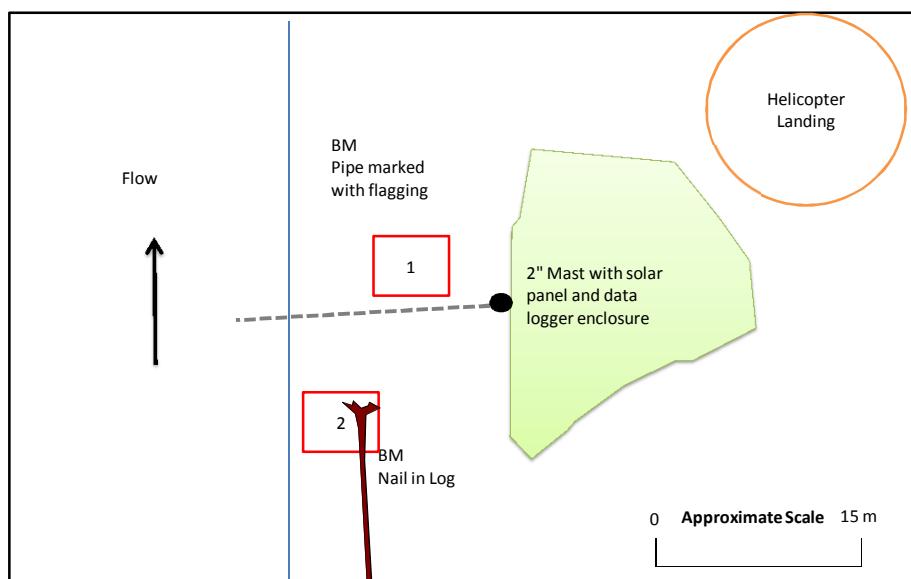

**BM 2**

**Elevation:** 100.085 m

**Basis:** Level survey from BM1

**Location:** Log on right bank 25 m up:

**Description:** Nail in log marked with flagging.

Benchmark Notes: Approximate geodetic elevation of Benchmark 2 based on 2011 differential GPS program 446±0.5m

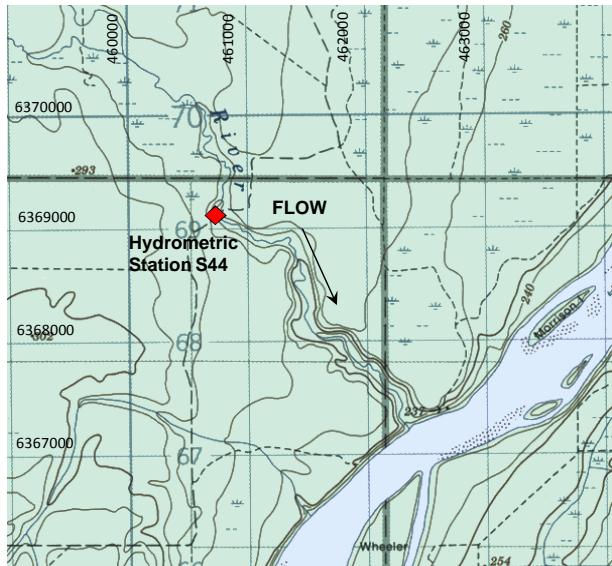

Revised 8 March, 2012

**Location and Purpose:**

Established to monitor discharge on Pierre River. Installed at Environment Canada hydrometric station (07DA013) that previously operated from 1975 to 1977.

**Variable Measured:** Water level, discharge, and water temperature  
**Period of Record:** 1975-1977, May 2009 - present  
**Access:** Helicopter access  
**Drainage Area:** 123 km<sup>2</sup>  
**Coordinates:** 12 V 460775 E, 6369400 N

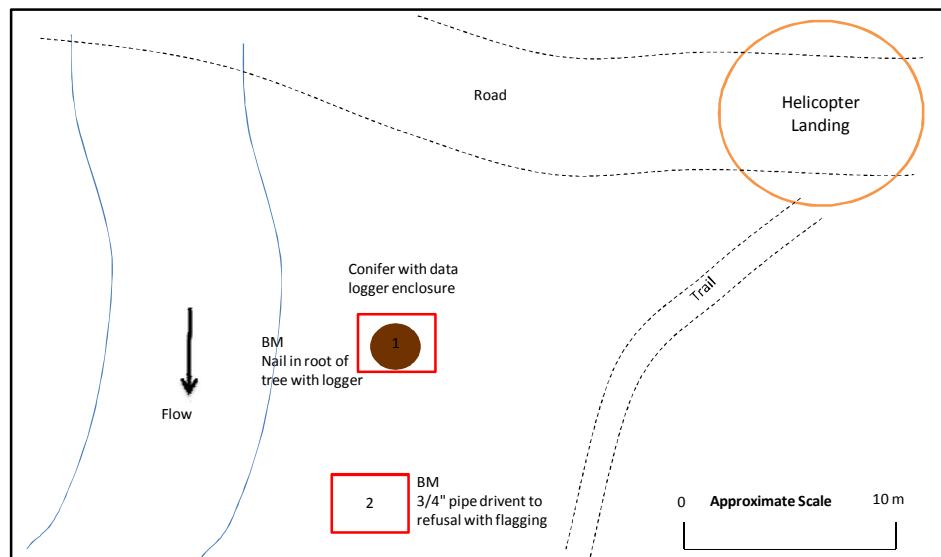

**Active:** Open Water Period  
**Lat/Long:** 57°27'52.5" N, 111°39'14.9" W  
**NTS Map:** 74E05  
**LSD:**

**Benchmarks**

**BM:** 1  
**Elevation:** 99.996 m  
**Basis:** Level survey from BM2  
**Location:** Tree with data logger enclosure attached  
**Description:** Nail in tree root.

**BM:** 2  
**Elevation:** 99.878 m  
**Basis:** Assumed  
**Location:** 3/4" pipe driven to refusal  
**Description:** Pipe with flagging

Benchmark Notes: Approximate geodetic elevation of Benchmark 2 based on 2011 differential GPS program 261±0.5m

Revised 8 March, 2012

**Location and Purpose:**

Established to monitor discharge on Ells River upstream of the proposed Joslyn Creek Diversion and the Fort McKay water intake.

**Variable Measured:** Water level, discharge, and water temperature

**Period of Record:** June 2009 - present

**Access:** Helicopter access

**Drainage Area:** 2450 km<sup>2</sup>

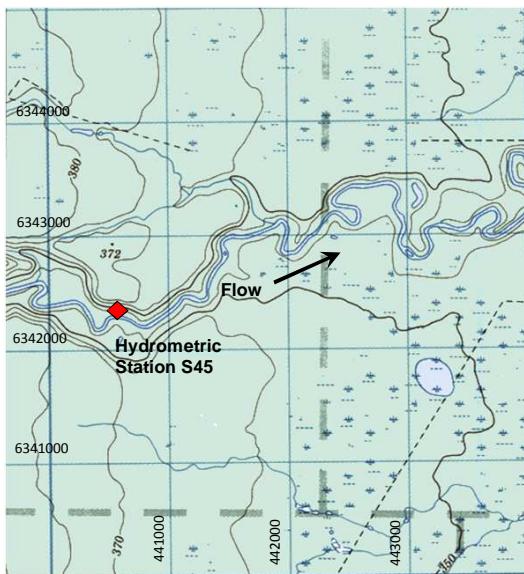

**Coordinates:** 12V 440605 E, 6342459 N

**Active:** Year around

**Lat/Long:** 57°13'17" N, 111°59'01" W

**NTS Map:** 74E04

**LSD:**

Map Grid Based on UTM NAD 27

**Benchmarks**

**BM:** 1

**Elevation:** 100

**Basis:** Assumed, survey date unknown

**Location:** 15 m upstream of data logger set up on left bank

**Description:** 3/4" pipe protruding 0.4m from surface

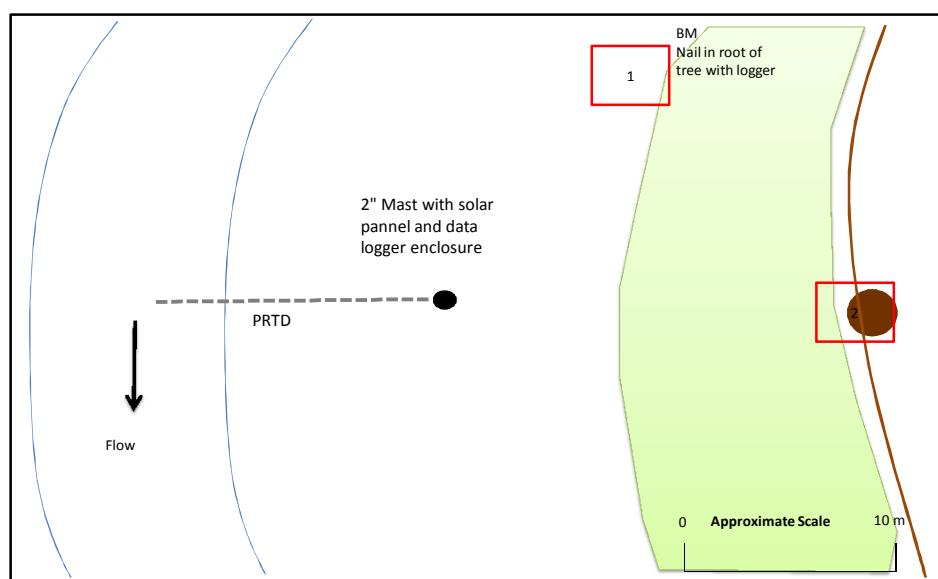

**BM:** 2

**Elevation:** 100.049 m

**Basis:** Level survey from BM1

**Location:** 10 m behind data logger set up

**Description:** Nail in stump on ledge

Benchmark Notes: Approximate geodetic elevation of Benchmark 1 based on 2011 differential GPS program 337±0.5m

Revised 27 March, 2012

**Location and Purpose:**

Station was established in August 2011 to monitor water level and discharge downstream of Oil Sands development.

**Variable Measured:** Water level, discharge, and water temperature  
**Period of Record:** August 2011 to present  
**Access:** Helicopter  
**Drainage Area:** 162000 km<sup>2</sup>  
**Coordinates:** 470241 E, 6463206 N (NAD 83) 12 V

**Active:** Year Round  
**Lat/Long:** 58°18'32" N, 111°30'28" W  
**NTS Map:** 74L05/06

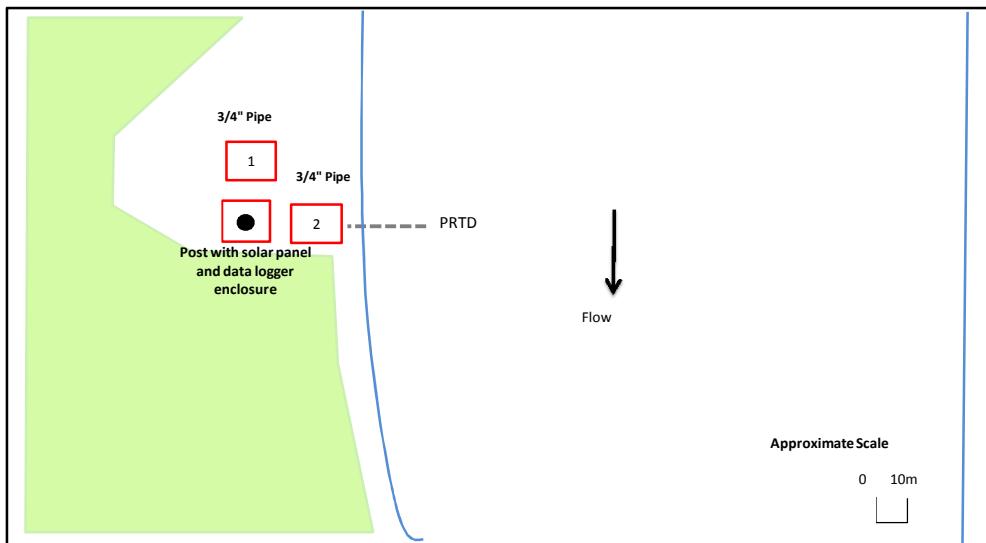

Map Grid Based on UTM NAD 27

**Benchmarks**

**BM:** 1  
**Elevation:** 100.00m  
**Basis:** Assumed  
**Location:**  
**Description:** 3/4" pipe on upper bench

**BM:** 2  
**Elevation:** 98.503m  
**Basis:** Level survey from BM1  
**Location:**  
**Description:** 3/4" pipe on lower bench

Benchmark Notes: Approximate geodetic elevation of Benchmark 2 based on 2011 differential GPS program 216 ± 0.5m

Revised 8 March, 2012

**Location and Purpose:**

Established to monitor water level and discharge on the Christina River near the mouth and downstream of all development in the Christina watershed.

**Variable Measured:** Water level, discharge, and water temperature

**Period of Record:** May 2011 - present

**Access:** Helicopter access

**Drainage Area:** 13,455 km<sup>2</sup>

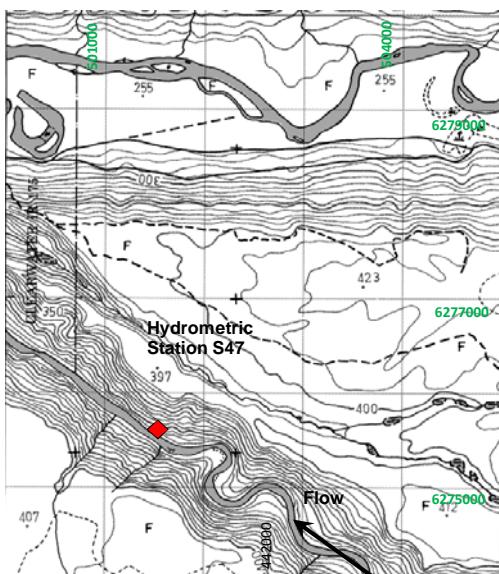

**Coordinates:** 12V 500672 E, 6276404 N

**Active:** Year Round

**Lat/Long:** 56°37'54"N, 110°59'20"W

**NTS Map:** 74D10

**LSD:**

Map Grid Based on UTM NAD 27

**Benchmarks**

**BM:** 1

**Elevation:** 100.095 m

**Basis:** Level survey from BM2

**Location:** Nail in Base of Tree with Data logger attached

**Description:** Nail with flagging

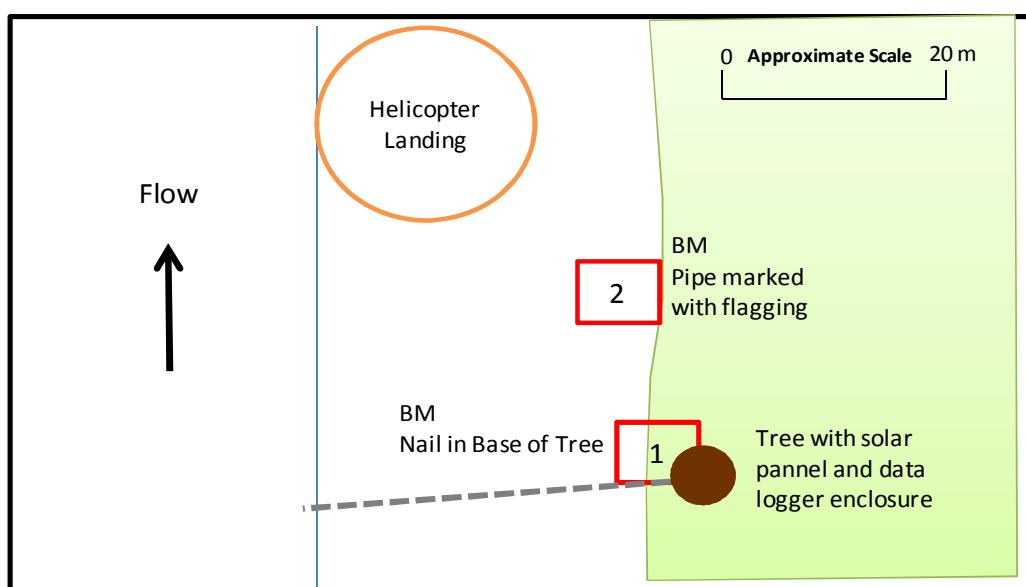

**BM:** 2

**Elevation:** 100.000 m

**Basis:** Assumed

**Location:** 10 metres downstream of tree with logger

**Description:** 3/4" Pipe with Flagging

Benchmark Notes: Approximate geodetic elevation of Benchmark 1 based on 2011 differential GPS program 261.5±0.5m

Revised 8 March, 2012

**Location and Purpose:**

Established to monitor water level and discharge on Big Creek near the mouth to establish baseline conditions prior to construction of the Pierre River Mine.

**Variable Measured:** Water level, discharge, and water temperature

**Period of Record:** May 2011 - present

**Access:** Helicopter access

**Drainage Area:** 304 km<sup>2</sup>

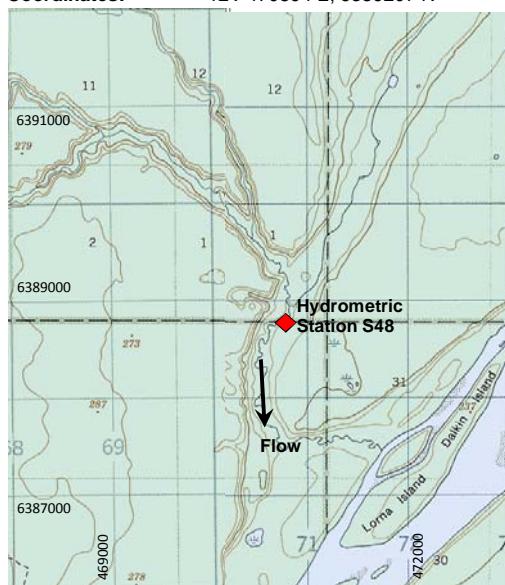

**Coordinates:** 12V 470894 E, 6389207 N

**Active:** Open Water Season

**Lat/Long:** 57°38'39" N, 111°29'15" W

**NTS Map:** 74E11

**LSD:**

Map Grid Based on UTM NAD 27

**Description:** 3/4" pipe

**BM:** 2  
**Elevation:** 99.791 m  
**Basis:** Level survey from BM1  
**Location:** 6m North of Data Logger  
**Description:** Nail in clump

Benchmark Notes: Approximate geodetic elevation of Benchmark 1 based on 2011 differential GPS program 228±0.5m

## C.6 INVENTORY OF CLIMATE AND HYDROLOGIC DATA IN THE RAMP DATABASE

An inventory of the climate and hydrologic data collected by RAMP, and contained in the RAMP database, is provided on the following pages (Table C.6-1). These data will be made available on the RAMP website, subsequent to this report being published.

In addition to the data collected by RAMP, data from the following sources contributed to the analyses in the 2011 WY RAMP Technical Report and Appendices including:

- Water Survey of Canada (WSC)  
[\(http://www.wsc.ec.gc.ca/\)](http://www.wsc.ec.gc.ca/)
  - Provisional WSC hydrologic data has been used when final data are not yet available. In the RAMP database, data for a joint WSC/RAMP Station are provided starting with the year in which RAMP monitoring began. To provide regional context RAMP stations are identified where historic WSC data are available to extend the record length.
- Environment Canada (EC)  
[\(http://climate.weatheroffice.gc.ca/climateData/canada\\_e.html\)](http://climate.weatheroffice.gc.ca/climateData/canada_e.html)
  - Provisional EC climate data has been used when final data are not yet available.
- Industry Data
  - Volumes of water released and withdrawn, as part of RAMP focal activities, were supplied by each company.

**Table C.6-1 Inventory of climate and hydrologic data collected by RAMP.**

<b>Hydrometric Station</b>	<b>Data Type</b>	<b>From</b>	<b>To</b>
S01 - Alsands Drain	Discharge	1995-08-10	2002-12-31

## **C.7 STATION VISIT RECORDS AND MANUAL MEASUREMENTS**

Records of the manual hydrometric measurements made during each station visit are provided on the following pages. The quality and expected precision of each manual discharge measurement was assessed considering the hydraulic conditions, at the measurement section, at the time of the measurement.

## Hydrometric Measurement / Site Visit Record

**Site:** C1 - Aurora Climate Station

**UTM Location:** 475734E, 6343967 N

**Site Visit Date:** Jan. 16, 2011

<b>Datalogger Details:</b>	
Battery (Main):	13.7
Datalogger Clock:	12:40
Laptop Clock:	12:38
Air Temperature °C:	-30.9
RH (%):	72.4
Snow Depth (cm):	38.7
Wind Speed (m/s):	3.3
Wind Direction (deg):	8
Solar Radiation (kw/m <sup>2</sup> )	0.010
Barometric Pressure (kpa):	141.3
Precipitation Before (mm):	-
Precipitation After (mm):	-
Logger# (if Δ):	
<b>Datalogger / Station Notes:</b>	

<b>Measurement Details:</b>	
Start Time (MST):	12:30
End Time (MST):	-
Station Condition:	OK
Weather:	-

### **General Notes:**

Snowdepth was reading 0.43m, checked manually, was OK.Changed battery.

Memory Used.

**General Notes:** 4 holes drilled upstream (now under bridge) of last transect, but 3 were dry. 1 filled up with water but water depth was less than 10cm deep under ice. No reliable velocity possible in this hole (three attempts were all negative). Tried another hole in river centre, downstream of previous transect and straighter section, but this was also dry. Similar observations to March 18, 2006, then effectively dry.

## Datalogger / Station Notes:

m=1.412017, b=-0.083509

## Level Survey:

Position	Description	Setup 1		Setup 2		Average
		(m)	El (m)	(m)	El (m)	
Bench Mark 1:	T-bar in PVC pipe	2.038	360.610	2.017	360.610	-
Bench Mark 2:	Rebar with pink flagging	1.394	361.201	1.372	361.201	-
Top of Ice:						
Water Level:		3.262	359.386	3.245	359.382	359.384
Transducer Reading:		0.740	358.646	0.740	358.642	358.644
Other:						

## General Notes:

Poor flow measurements. Broke ice to access water, causing substantial error, therefore went to 60% depth measurements.  
Ice too thin to sample.

Total Flow **0.018**

## Measurement Details:

Start Time (MST):	14:56
End Time (MST):	15:42
Equipment:	ADV
Method:	Wading
River Condition:	Open
Quality/Error (see reverse):	Good
Weather:	5°, Overcast

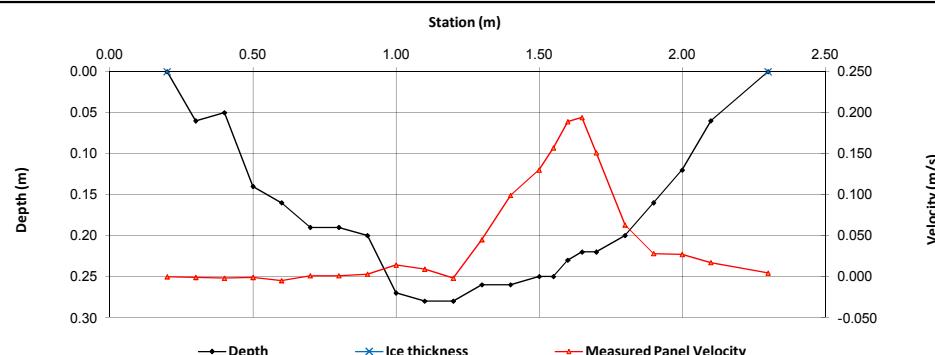

## Flow characteristics:

Total Flow:	<b>0.018</b>	(m <sup>3</sup> /s)
Percieved Measurment Quality:	Good	
Cross Section Area:	<b>0.36</b>	(m <sup>2</sup> )
Wetted Width:	<b>2.10</b>	(m)
Hydraulic Depth:	<b>0.173</b>	(m)
Mean Velocity:	<b>0.049</b>	(m/s)
Froude Number:	<b>0.037</b>	

Datalogger Details:	Before	After

## Datalogger / Station Notes:

## Level Survey:

Position	Description	Setup 1		Setup 2		Average
		(m)	EI (m)	(m)	EI (m)	
Bench Mark 1:	T-post near logger	1.445	98.250	1.435	98.250	-
Bench Mark 2:	Pipe w/pink flagging	1.399	98.369	1.389	98.369	-
Top of Ice:		2.417	97.351	2.410	97.348	97.350
Water Level:		2.439	97.256	2.425	97.260	97.258
Transducer Reading:		1.241	96.015	1.241	96.019	96.017
Other:						

## General Notes:

Post 5.3m, gauge depth switched to 0.6d due to erratic numbers at 0.2d and 0.8d likely due to slush throughout water column.  
One measurement per hole past 5.0m due to low flow.

Total Flow **0.181**

## Measurement Details:

Start Time (MST):	9:40
End Time (MST):	10:45
Equipment:	ADV
Method:	Fishcat
River Condition:	Open
Quality/Error (see reverse):	Good
Weather:	Sunny, 20°C

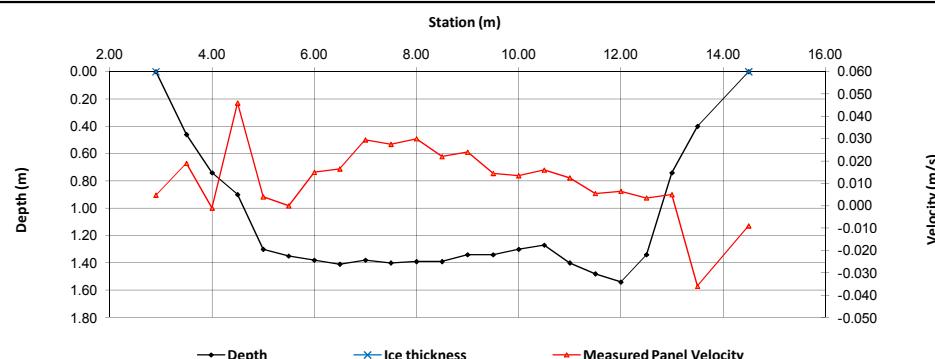

## Flow characteristics:

Total Flow:	<b>0.181</b>	(m <sup>3</sup> /s)
Percieved Measurment Quality:	Good	
Cross Section Area:	<b>12.83</b>	(m <sup>2</sup> )
Wetted Width:	<b>11.60</b>	(m)
Hydraulic Depth:	<b>1.106</b>	(m)
Mean Velocity:	<b>0.014</b>	(m/s)
Froude Number:	<b>0.004</b>

#### **General Notes:**

**General Notes:**  
No flow measurements taken due to open and flowing water downstream (full width) and against left bank (see photos). Conditions deemed unsafe.

Other:						

## General Notes:

Flow gauge abandoned - beaver dam impact and low water giving substantial recirculation issues and negative numbers. Poor discharge site.

Transducer Reading:		1.561	98.846	1.561	98.846	98.846
Other:						

## General Notes:

Drilled 10 holes in middle of river; no distinct velocities measured (i.e. >0.01m/s), hence further drilling and measuring stopped. Note that there was essentially no flow during most of the open-water period due to beaver activity in area.

Total Flow **0.635**

## Measurement Details:

Start Time (MST):	14:00
End Time (MST):	14:20
Equipment:	ADV
Method:	Wading
River Condition:	Open
Quality/Error (see reverse):	Good
Weather:	Clear, 11 °C

## Flow characteristics:

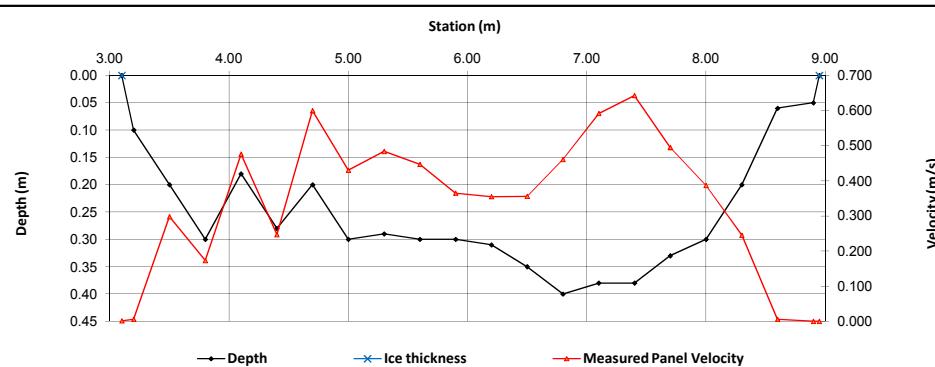

Total Flow:	0.635	(m <sup>3</sup> /s)
Perceived Measurement Quality:	Good	
Cross Section Area:	1.55	(m <sup>2</sup> )
Wetted Width:	5.85	(m)
Hydraulic Depth:	0.265	(m)
Mean Velocity:	0.410	(m/s)
Froude Number:	0.255

Other:						

## General Notes:

Flow gauge deemed unsafe. Ice thickness approx 12" but fully saturated with water. Water was filling auger hole before hole completely drilled through, therefore 50% decline in strength. Fill was from below. Ice was able to be removed with a finger at 6" depth. Open, flowing water downstream with large cracks. Water can be heard flowing at gauging station. Middle section of river has sagged significantly.

## Measurement Details:

Start Time (MST):	14:05
End Time (MST):	14:20
Equipment:	-
Method:	-
River Condition:	Partially open
Quality/Error (see reverse):	-
Weather:	Light precip, -6°C

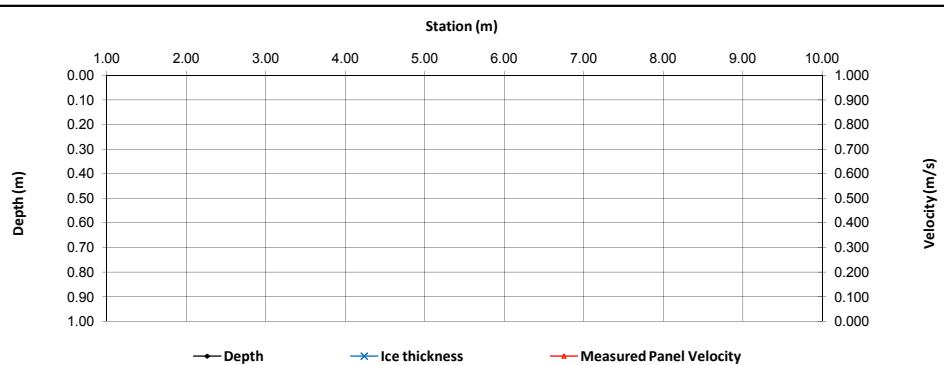

## Flow characteristics:

Total Flow:	-	(m <sup>3</sup> /s)
Perceived Measurement Quality:	-	
Cross Section Area:	0.00	(m <sup>2</sup> )
Wetted Width:	0.00	(m)
Hydraulic Depth:	-	(m)
Mean Velocity:	-	(m/s)
Froude Number:	-	

## Datalogger Details:

	Before	After
Transducer Reading:	1.12	
Battery (Main):	14.62	
Battery (Aux):	4.51	
Datalogger Clock:	12:51	
Laptop Clock:	13:12	
Air Temperature °C:	-	
Air Pressure:	-	
RH:	-	
Water °C:	0.14	
Memory Used:	11%	
Dessicant:	Changed	
Logger# (if Δ):		
PT# (if Δ):		

## Datalogger / Station Notes:

## Level Survey:

Position	Description	Setup 1		Setup 2		Average
		(m)	EI (m)	(m)	EI (m)	
Bench Mark 1:	Top of pipe w/bubbler		101.930		101.930	
Bench Mark 2:	Rebar w/orange flagging		100.000		100.000	
Top of Ice:						
Water Level:						
Transducer Reading:						
Other:						

## General Notes:

River ice too thin for gauging and to drill hole for water level. Approximately 1" of ice, 1m from bank.

Total Flow **3.415**

## Measurement Details:

Start Time (MST):	15:01
End Time (MST):	16:00
Equipment:	ADV
Method:	Fishcat
River Condition:	Open
Quality/Error (see reverse):	Excellent
Weather:	-

## Flow characteristics:

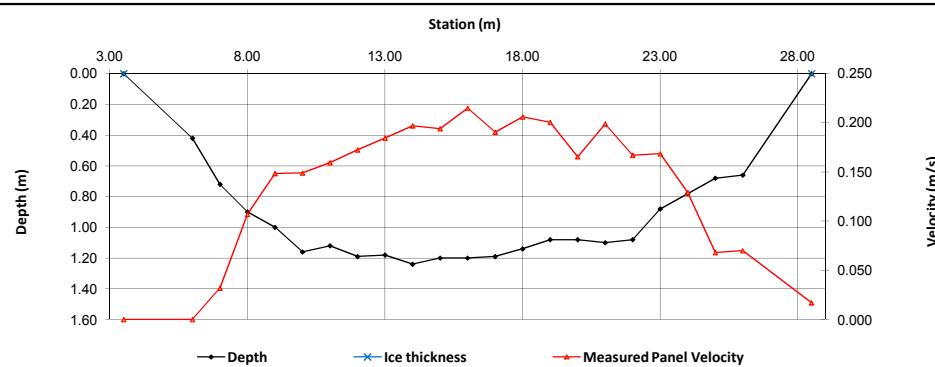

Total Flow:	3.415	(m <sup>3</sup> /s)
Percieved Measurment Quality:	Excellent	
Cross Section Area:	22.24	(m <sup>2</sup> )
Wetted Width:	25.00	(m)
Hydraulic Depth:	0.890	(m)
Mean Velocity:	0.154	(m/s)
Froude Number:	0.052	

## Datalogger Details:

Before	After
Transducer Reading:	0.942
Battery (Main):	13.82
Battery (Aux):	-
Datalogger Clock:	3:02
Laptop Clock:	3:02
Air Temperature °C:	-
Air Pressure:	-
RH:	-
Water °C:	14.50
Memory Used:	-
Dessicant:	replaced
Logger# (if Δ):	
PT# (if Δ):	

## Datalogger / Station Notes:

Campbell Sci enclosure installed. Values checked afterwards.

## Level Survey:

Position	Description	Setup 1		Setup 2		Average
		(m)	EI (m)	(m)	EI (m)	
Bench Mark 1:	Top of pipe w/bubbler	0.282	101.930	0.273	101.930	-
Bench Mark 2:	Rebar w/orange flagging	2.078	100.000	2.068	100.000	-
Top of Ice:						
Water Level:		4.206	98.006	4.198	98.005	98.006
Transducer Reading:		0.942	97.064	0.942	97.063	97.064
Other:						

## General Notes:

Moved CR800 Logger to Campbell Sci enclosure.

## Datalogger / Station Notes:

Intermittent logger response. PTs not working. 15m PLS installed, needs burying at lower water.

## Level Survey:

Position	Description	Setup 1		Setup 2		Average
		(m)	El (m)	(m)	El (m)	
Bench Mark 1:	T-bar 1m tall	0.192	231.347	0.188	231.347	-
Bench Mark 2:	Nail in birch tree	0.457	231.096	0.453	231.096	-
Top of Ice:						
Water Level:		3.940	227.613	3.938	227.611	227.612
Transducer Reading:						
Other:	PLS					

## General Notes:

Note: some slight drift downstream on some measurements due to anchor not being able to grab onto sandy bottom and therefore not perfectly stabilising boat for velocity measurement.

## Datalogger / Station Notes:

30m transducer installed and launched from boat several meters from current shoreline, under ~3m of water and complete with 20lbs of weight plus chain. Could only get real-time output from 15m PLS while running both simultaneously, need a program to run 2xPLS successfully.
Note: some slight drift downstream on some measurements due to anchor not being able to grab onto sandy bottom and therefore not perfectly stabilising boat for velocity measurement.

Total Flow **522.096**

## Measurement Details:

Start Time (MST):	14:00
End Time (MST):	15:40
Equipment:	ADC
Method:	Boat
River Condition:	Clear, light chop
Quality/Error (see reverse):	Excellent
Weather:	sunny

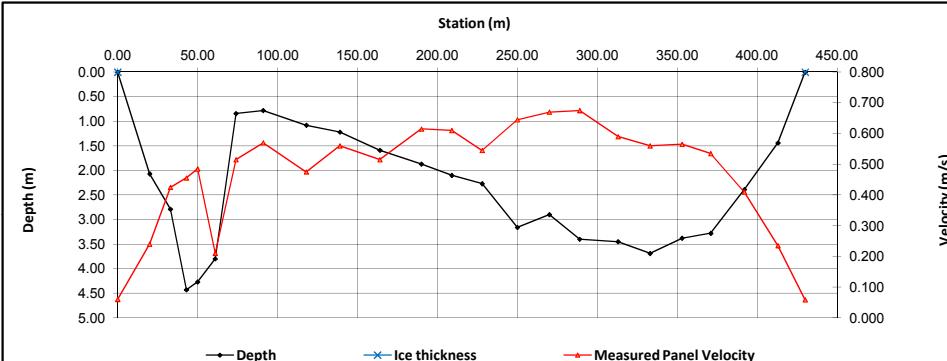

## Flow characteristics:

Total Flow:	<b>522.096</b> (m <sup>3</sup> /s)
Percieved Measuremt Quality:	Excellent
Cross Section Area:	1000.39 (m <sup>2</sup> )
Wetted Width:	430.00 (m)
Hydraulic Depth:	2.327 (m)
Mean Velocity:	0.522 (m/s)
Froude Number:	0.109

## Datalogger Details:

## General Notes:

Reconnected PLS ground wire and solar panel wires. Secured cables.  
Removed 15 m PLS which was dry.

Total Flow **0.272**

## Measurement Details:

Start Time (MST):	9:00
End Time (MST):	12:00
Equipment:	ADV
Method:	Wading
River Condition:	Open
Quality/Error (see reverse):	Good
Weather:	Overscast, 15°C

## Flow characteristics:

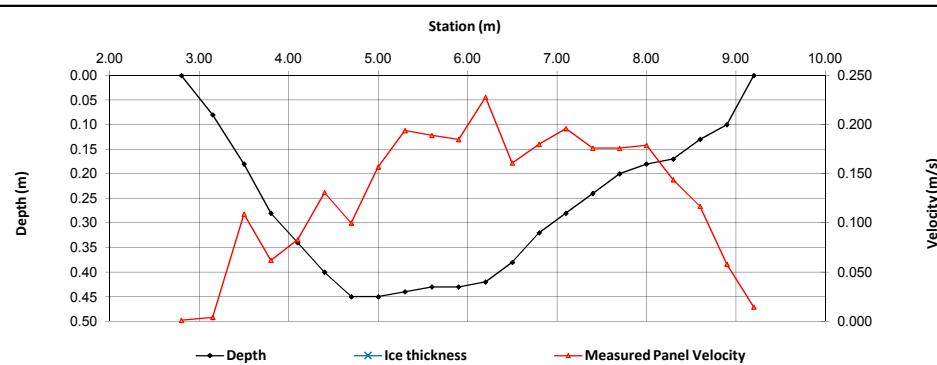

Total Flow:	<b>0.272</b>	(m <sup>3</sup> /s)
Perceived Measurement Quality:	Good	
Cross Section Area:	<b>1.79</b>	(m <sup>2</sup> )
Wetted Width:	<b>6.40</b>	(m)
Hydraulic Depth:	<b>0.279</b>	(m)
Mean Velocity:	<b>0.152</b>	(m/s)
Froude Number:	<b>0.092</b>	

## Datalogger Details:

Before	After
Transducer Reading:	0.448 0.354
Battery (Main):	5.4 5.44
Battery (Aux):	14.4 14.39
Datalogger Clock:	- 10:58
Laptop Clock:	- 11:04
Air Temperature °C:	-
Air Pressure:	-
RH:	-
Water °C:	-
Memory Used:	10% 10%
Dessicant:	- Changed
Logger# (if Δ):	
PT# (if Δ):	603609

## Datalogger / Station Notes:

Collected PT data looks bad, possibly due to faulty sensor or logger. PT changed and checked water depth manually (was OK).  
 Precipitation (before) = 1.414708, (after) = -0.08335

Total Flow **3.444**

## Measurement Details:

Start Time (MST): 11:00

End Time (MST): 12:00

Equipment: ADV

Method: Wading

River Condition: Open

Quality/Error (see reverse): Excellent

Weather: Clear, 2°C

## Flow characteristics:

Total Flow: **3.444** (m³/s)

Perceived Measuremt Quality: Excellent

Cross Section Area: 13.22 (m²)

Wetted Width: 7.53 (m)

Hydraulic Depth: 1.756 (m)

Mean Velocity: 0.261 (m/s)

Froude Number: 0.063

***Measurement Details:***

Start Time (MST):	16:15
End Time (MST):	17:10
Equipment:	-
Method:	-
River Condition:	Open
Quality/Error (see reverse):	-
Weather:	-

**Datalogger Details:**

Datalogger Details:	Before	After
Transducer Reading:	3.439	0.480
Battery (Main):	4.2	14.2
Battery (Aux):	14.3	
Datalogger Clock:	16:06	
Laptop Clock:	16:13	
Air Temperature °C:	-	
Air Pressure:	-	
RH:	-	
Water °C:	-	17.4
Memory Used:	10%	
Dessicant:	Old	
Logger# (if any):	DD	CR800

PT# (if Δ):

**Datalogger / Station Notes:**

## Level Survey:

Position	Description	Setup 1		Setup 2		Average
		(m)	El (m)	(m)	El (m)	
Bench Mark 1:	Nail in tree w/flagging		100.000		100.000	-
Bench Mark 2:	Pipe w/flagging 3mE of BM1		99.923		99.923	-
Top of Ice:						
Water Level:			100.000		100.000	100.000
Transducer Reading:		3.439	96.561	3.439	96.561	96.561
Other:						

**General Notes:**

Burn marks from forest fire >500m away, most directions. Purpose of trip was to check station function after fires, and to upgrade station to Campbell Scientific hardware.

Total Flow **0.013**

## Measurement Details:

Start Time (MST):	15:55
End Time (MST):	17:45
Equipment:	ADV
Method:	Wading
River Condition:	Open
Quality/Error (see reverse):	Good
Weather:	Clear, 2°C

## Flow characteristics:

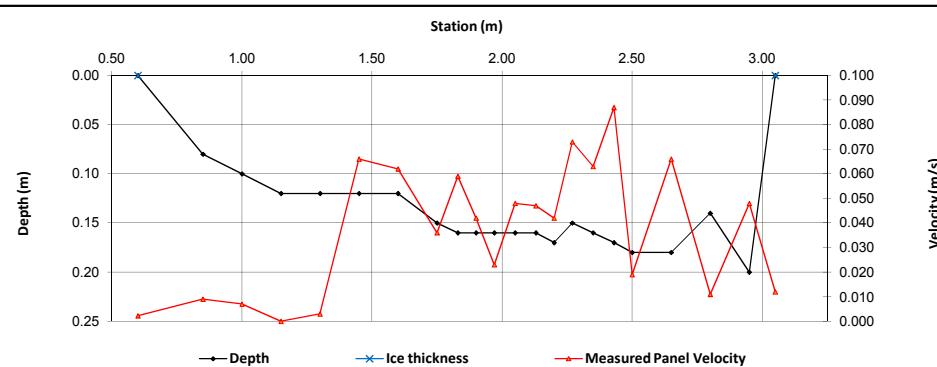

Total Flow:	0.013	(m <sup>3</sup> /s)
Perceived Measurement Quality:	Good	
Cross Section Area:	0.33	(m <sup>2</sup> )
Wetted Width:	2.45	(m)
Hydraulic Depth:	0.133	(m)
Mean Velocity:	0.039	(m/s)
Froude Number:	0.034	

## Datalogger Details:

Before	After
Transducer Reading:	0.214
Battery (Main):	4.4
Battery (Aux):	13.4
Datalogger Clock:	15:59
Laptop Clock:	16:02
Air Temperature °C:	-
Air Pressure:	-
RH:	-
Water °C:	-
Memory Used:	32%
Dessicant:	replaced

## Level Survey:

Position	Description	Setup 1		Setup 2		Average
		(m)	El (m)	(m)	El (m)	
Bench Mark 1:	3/4" pipe, w/flag, behind logger	1.303	100.000	1.271	100.000	-
Bench Mark 2:	T-post on second bench	3.375	97.893	3.343	97.893	-
Top of Ice:		5.011	96.292	4.974	96.297	96.295
Water Level:		4.985	96.318	4.954	96.317	96.318
Transducer Reading:		0.764	95.554	0.764	95.553	95.554
Other:						

## General Notes:

Effective water depth very shallow. Signal to noise ratio very high, two velocity readings required at most holes. Holes drilled at offsets 16.3, 13.7, 12.6, and 9.90 were dry (no water).

Total Flow **3.530**

## Measurement Details:

Start Time (MST):	11:30
End Time (MST):	13:30:00 PM
Equipment:	ADV
Method:	Wading
River Condition:	Open
Quality/Error (see reverse):	Excellent
Weather:	Smoke, 21 deg C

## Flow characteristics:

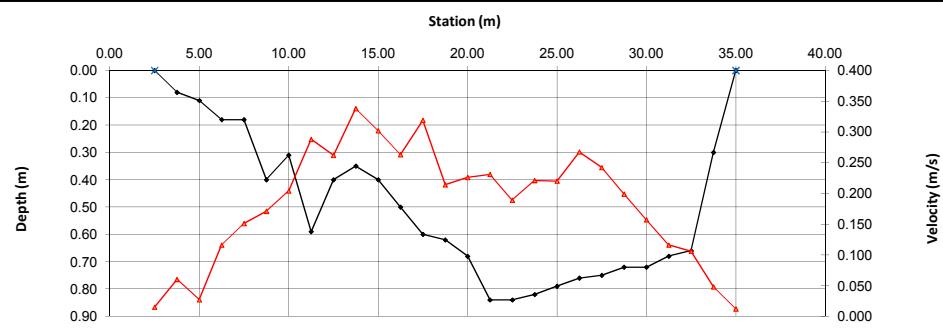

Total Flow:	3.530	(m <sup>3</sup> /s)
Percieved Measuremt Quality:	Excellent	
Cross Section Area:	16.70	(m <sup>2</sup> )
Wetted Width:	31.25	(m)
Hydraulic Depth:	0.534	(m)
Mean Velocity:	0.211	(m/s)
Froude Number:	0.092	

## Datalogger Details:

Transducer Reading:	Before	After

Total Flow **43.276**

## Measurement Details:

Start Time (MST):	15:15
End Time (MST):	16:45
Equipment:	ADV
Method:	Ice
River Condition:	Ice
Quality/Error (see reverse):	Good
Weather:	Clear

## Flow characteristics:

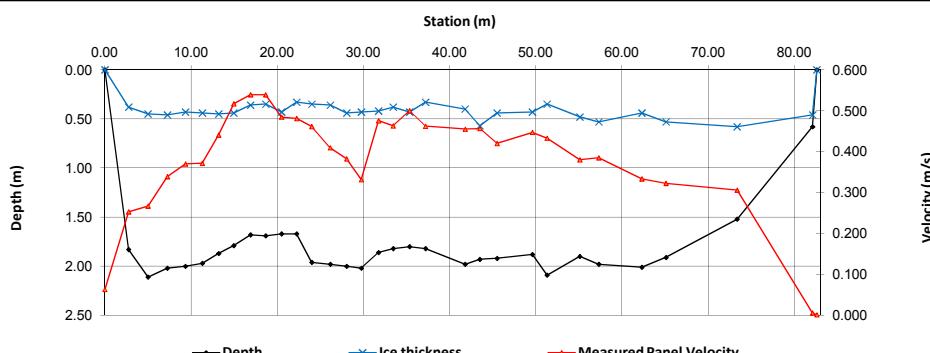

Total Flow:	<b>43.276</b>	(m <sup>3</sup> /s)
Percieved Measuremt Quality:	Good	
Cross Section Area:	<b>109.47</b>	(m <sup>2</sup> )
Wetted Width:	<b>82.60</b>	(m)
Hydraulic Depth:	<b>1.325</b>	(m)
Mean Velocity:	<b>0.395</b>	(m/s)
Froude Number:	<b>0.110</b>

## General Notes:

More problems with ADC readouts. 0 velocities given for long periods, but water depths were fine. Began to work OK at 0.6D but more problems at 0.8D hence decision to go with 0.6D. Problems to be investigated with OTT, and backup (Marsh/ADV) to be taken on future visits.

Other:						

## General Notes:

Purpose of extra trip was to dig up PT and place lower in water (was 40cm under water on 13-Aug) with remaining helicopter time available. PT wire etc had been pulled by wildlife that day (teeth marks visible) resulting in ~6hours loss of data. Maybe more burying at much lower water, required.

Total Flow **1.741**

## Measurement Details:

Start Time (MST):	12:30
End Time (MST):	13:30
Equipment:	ADV
Method:	Wading
River Condition:	Open
Quality/Error (see reverse):	Excellent
Weather:	Partly Cloudy, 25°C

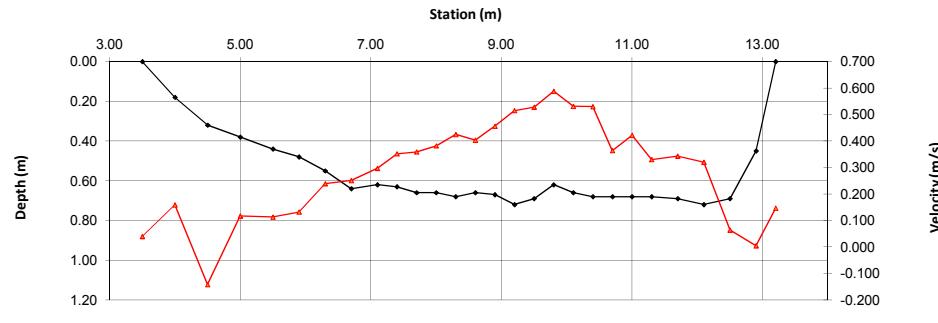

## Flow characteristics:

Total Flow:	1.741	(m <sup>3</sup> /s)
Perceived Measurement Quality:	Excellent	
Cross Section Area:	5.64	(m <sup>2</sup> )
Wetted Width:	9.70	(m)
Hydraulic Depth:	0.581	(m)
Mean Velocity:	0.309	(m/s)
Froude Number:	0.129	

## Datalogger Details:

## Datalogger / Station Notes:

## Level Survey:

Position	Description	Setup 1		Setup 2		Average
		(m)	EI (m)	(m)	EI (m)	
Bench Mark 1:	3/4" pipe 4m to west of station	0.869	100.000	0.857	100.000	-
Bench Mark 2:	Nail in base of tree, 6m to N or station	1.100	99.769	1.087	99.769	-
Top of Ice:						
Water Level:		1.693	99.176	1.679	99.178	99.177
Transducer Reading:		0.969	98.207	0.969	98.209	98.208
Other:	Upstream	1.350				

## General Notes:

Beaver dam upstream of station. Water behind dam is higher, therefore changed flow pattern. Measured second tributary contributing to flow. Measured at 0.6 due to silty bottom. Small loss of flow in 3-4 tributaries at side.

## D WATER QUALITY COMPONENT

### D.1 ANALYTICAL CHEMISTRY METHODS

Analytical methods used for the RAMP Water Quality component, along with associated detection limits and analysis-specific Variable Method Values (VMV codes), are presented in Table D.1-1. Information about analyses for naphthenic acids/acid-extractable organics undertaken by AITF and University of Alberta have been excluded from this table and are discussed in detail in Section 6.

**Table D.1-1 Analytical methods, method detection limits, and Variable Method Values (VMV codes) for water quality variables measured by analytical laboratories for RAMP in 2011.**

Analyte Category	Analyte	Units	Detection Limit	Analytical Method	VMV Code	Lab
Conventional variables	Alkalinity, Total (as CaCO <sub>3</sub> )	mg/L	5	APHA 4500-H, 2510, 2320	10165	ALS
Conventional variables	Conductivity	µS/cm	0.2	APHA 4500-H, 2510, 2320	2041	ALS
Conventional variables	Dissolved Organic Carbon	mg/L	1	APHA 5310 B-Instrumental	6101	ALS
Conventional variables	Hardness (as CaCO <sub>3</sub> )	mg/L	(Calculated)	APHA 1030E	10602	ALS
Conventional variables	pH	pH	0.1	APHA 4500-H, 2510, 2320	10301	ALS
Conventional variables	Total Dissolved Solids	mg/L	5 to 10	APHA 2540 C	10451	ALS
Conventional variables	Total Organic Carbon	mg/L	1	APHA 5310 B-Instrumental	6001	ALS
Conventional variables	Total Suspended Solids	mg/L	3	APHA 2540 D-Gravimetric	102455	ALS

## D.2 CALCULATED DETECTION LIMITS FOR WATERBORNE PAHS

Ultra-trace analysis of PAHs in water was introduced to RAMP in the 2011 program, with analysis conducted by AXYS Analytical Ltd. (AXYS) using low-resolution mass spectrometry (LRMS). Results for 43 parent and alkylated PAH homologues were reported, with analytical reporting (detection) limits of approximately 0.1 ng/L. Details of the analytical method are presented in the method summary from AXYS included in this appendix.

As described in Section 6.3, reporting limits varied by PAH species across results (i.e., among stations and seasons). Also, several blank samples showed measurable concentrations of some PAH species. To allow for reliable comparisons of results among samples collected from different locations (and with different specific reporting limits), blank-corrected detection limits were calculated for all PAH species, and applied to each reported result for use in data reporting and interpretation. These blank-corrected detection limits for specific PAH species were applied across the entire 2011 RAMP water quality dataset, so that all results measured by RAMP for a given PAH species had the same detection limit applied for data from all stations and seasons. Mechanisms for calculating these blank-corrected detection limits for RAMP 2011 are discussed in Section 6.3. Comparisons between original and blank-corrected detection limits are provided in Table D.2-1.

This blank-correction process resulted in substantial increases in detection limits in most cases, although a small majority of analytes maintained detection limits below 1 ng/L. One result of applying these blank-corrected detection/reporting limits was an increase in the number of non-detectable concentrations. However, this was necessary to reduce the likelihood of false positives in the dataset.

**Table D.2-1 Original reporting limits versus blank-corrected detection limits for individual PAH species/homologues, RAMP 2011 data.**

Analyte	Mean of original Reporting Limits	Blank-corrected Detection Limit
Biphenyl	0.11	1.09
C1-Biphenyls	0.10	5.08
C2-Biphenyls	0.13	49.03

## **Summary of AXYS Method MLA-021 Rev 10.02:**

# **ANALYTICAL METHOD FOR THE DETERMINATION OF POLYCYCLIC AROMATIC HYDROCARBONS (PAH), ALKYLATED POLYCYCLIC AROMATIC HYDROCARBONS, AND ALKANES**

AXYS Method MLA-021 describes the determination of concentrations of PAHs, alkylated PAHs and alkanes in solid (sediment, soil, ash), tissue (including blood), aqueous, XAD-2 column (resin and filters), air, and oil samples and in solvent extracts.

The method may be used for analysis of samples where USEPA Methods 1625B or 8270C/D have been requested **provided the modifications described in this document are permitted by contract.**

This summary document covers only the analysis of PAHs and alkylated PAHs.

### **Target Analytes**

#### **PAHs and alkylated PAHs determined by multi-point calibration**

##### **PAHs**

Naphthalene	Benzo(b)fluoranthene
Acenaphthylene	Benzo(j/k)fluoranthenes
Acenaphthene	Benzofluoranthenes
Fluorene	Benzo(e)pyrene
Phenanthrene	Benzo(a)pyrene
Anthracene	Perylene
Fluoranthene	Dibenzo(ah)anthracene
Pyrene	Indeno(1,2,3-cd)pyrene
Benz(a)anthracene	Benzo(ghi)perylene
Chrysene	

##### **Alkylated PAHs**

1-Methylnaphthalene	9/4-Methylphenanthrenes
2-Methylnaphthalene	2-Methylnanthracene
C1-Naphthalenes	C1-Phenanthrenes/Anthracenes
1,2-Dimethylnaphthalene	1,7-Dimethylphenanthrene
2,6-Dimethylnaphthalene	1,8-Dimethylphenanthrene
C2-Naphthalenes	2,6-Dimethylphenanthrene
2,3,5-Trimethylnaphthalene	3,6-Dimethylphenanthrene
2,3,6-Trimethylnaphthalene	C2-Phenanthrenes/Anthracenes
C3-Naphthalenes	1,2,6-Trimethylphenanthrene
1,4,6,7-Tetramethylnaphthalene	C3-Phenanthrenes/Anthracenes
C4-Naphthalenes	Retene
1-Methylphenanthrene	C4-Phenanthrenes/Anthracenes
2-Methylphenanthrene	Biphenyl
3-Methylphenanthrene	Dibenzothiophene

**PAHs and alkylated PAHs determined by single-point calibration**

C1-Biphenyls	C1-Fluoranthenes/Pyrenes
C2-Biphenyls	C2-Fluoranthenes/Pyrenes
C1-Acenaphthenes	C3-Fluoranthenes/Pyrenes
2-Methylfluorene	C4-Fluoranthenes/Pyrenes
C1-Fluorenes	1-Methylchrysene
1,7-Dimethylfluorene	5/6-Methylchrysenes
C2-Fluorenes	C1-Benz(a)anthracenes/Chrysenes
C3-Fluorenes	5,9-Dimethylchrysenes
2/3-Methyldibenzothiophenes	C2-Benz(a)anthracenes/Chrysenes
C1-Dibenzothiophene	C3-Benz(a)anthracenes/Chrysenes
2,4-Dimethyldibenzothiophene	C4-Benz(a)anthracenes/Chrysenes
C2-Dibenzothiophene	7-Methylbenzo(a)pyrene
C3-Dibenzothiophene	C1-Benzofluoranthenes/Benzopyrenes
C4-Dibenzothiophene	C2-Benzofluoranthenes/Benzopyrenes
3-Methylfluoranthene/Benzo(a)fluorene	

**EXTRACTION**

All samples are spiked with deuterated surrogate standards prior to extraction and extracted as per the table below. Optional extraction procedures are shown within parentheses.

**Sample Extraction**

Matrix	Extraction
Aqueous	Sample with less than 1% suspended solids - Liquid-liquid extraction with dichloromethane. Sample with ≥1% suspended solids - sample is centrifuged prior to extraction and the particulate fraction separately extracted by Soxhlet extraction with dichloromethane. The two extracts are then combined.(Optional: the supernatant can be added to the extraction solvent for the particulate)
Solid (sediment, soil, sludge, particles on filter paper)	Soxhlet extraction with dichloromethane (Optional: Base digestion and liquid-liquid extraction with hexane)
Solid (ash)	Soxhlet extraction with toluene
Solid (fly ash)	Sonication with hydrochloric acid and filtering. Liquid-liquid extraction of filtrate using dichloromethane, Soxhlet extraction of particulate using toluene:acetone 80:20. The two extracts are combined.
Tissue	Base digestion and liquid-liquid extraction with hexane (Optional: Soxhlet extraction with dichloromethane, this option is not recommended for samples with high lipid content)
Whole blood/serum	Liquid-liquid extraction with ethanol:hexane:saturated ammonium sulphate.
XAD-2 column and filter	XAD-2 columns and filters are usually co-extracted for multiple analyses (For example: PCB, dioxins, pesticides) and the resulting extracts are split with a portion being used for PAH analysis

Ambient air (PUF and filter)	The PUF and filter(s) are Soxhlet extracted together using dichloromethane
Stationary Source Air Samples (Stack Gas sample trains)	The filter is sonicated with dilute hydrochloride acid and filtered. Equipment rinsates are collected, filtered, dried and/or extracted depending on sampling conditions.

## COLUMN CHROMATOGRAPHY CLEANUP

Extracts are routinely cleaned up using the following procedures:

- column chromatography on Silica
- gel permeation (Biobeads) column chromatography
- treatment with activated copper (except tissues)

Extracts may be cleaned up further, as necessary, using some or all of the following procedures:

- washing with base
- column chromatography on Biobeads
- column chromatography on alumina

## INSTRUMENTAL ANALYSIS

Instrumental analysis is performed by low-resolution mass spectrometry (LRMS) using an RTX-5 capillary GC column. The LRMS is operated at a unit mass resolution in the electron impact (EI) ionization mode using multiple ion detection (MID) acquiring at least one characteristic ion for each target analyte and surrogate standard.

## Analyte Ions Monitored, Surrogates Used and RRF Determination For PAH

**CALIBRATION**

Initial calibration is performed using a five point calibration series of solutions that encompass the working concentration range. Initial calibration solutions contain the suite of labelled surrogate and recovery standards and authentic target PAHs listed as "PAHs and alkylated PAHs determined by multi-point calibration". Calibration procedures use the mean RRFs determined from the initial calibration to calculate analyte concentrations. Calibration is verified at least once every 12 hours by analysis of a mid-level calibration solution.

An additional calibration solution contains the suite of labelled surrogate and recovery standards and authentic target PAHs listed as "PAHs and alkylated PAHs determined by single-point calibration". This calibration solution is analyzed at the beginning and end of each batch (bracket) of samples and is used to establish the relative response factors. The mean RRFs determined from the single calibration solution run before and after the samples are used for quantification of sample results.

## ANALYTE IDENTIFICATION

A chromatographic peak is identified as a target compound if the following criteria are met for the quantification and confirmation ions (where confirmation ions are available):

1. Peak responses must be at least three times the background noise level.
2. The retention time must be within three seconds of that predicted from the calibration run and the sample retention time reference (labelled compound).
3. Peak centroids for the quantification and confirmation ions must coincide within two seconds.
4. The relative ion abundance ratios must be within 20% of the opening calibration values.

## QUANTIFICATION

Concentrations of target PAHs are calculated using the isotope dilution method of quantification. Compounds are quantified by comparing the area of the quantification ion to that of the corresponding deuterium-labelled standard and correcting for response factors. Response factors are determined daily using authentic PAHs. Calculations are carried out using HP EnviroQuant and Prolab MS-Extended for targeting and quantification.

$$\text{Concentration of Target} = \left( \frac{\text{area of Target}}{\text{area of Surr Std}} \right) \times \left( \frac{\text{weight of Surr Std (ng)}}{\text{RRF}} \right) \times \left( \frac{1}{\text{weight of sample (g or L)}} \right)$$

(ng/g or ng/L)

$$\text{where } \text{RRF} = \left( \frac{\text{area of Target}}{\text{area of Surr Std}} \right) \times \left( \frac{\text{concentration of Surr Std}}{\text{concentration of Target}} \right)$$

*and the Surr Std is either the surrogate or the internal standard*

## REPORTING LIMITS

Concentrations and detection limits for the target PAHs are reported. Typical reporting units for all data are ng/g, ng/L, or ng/sample. Concentrations for solids are reported on a dry weight basis. Concentrations in tissues (including blood and milk) are reported on a wet weight basis and/or on a lipid weight basis when requested. Concentrations in aqueous are reported on a volume basis. Concentrations in XAD-2 resin, filters and stack gas samples are reported on a per sample basis or a per volume basis. Concentrations in particulate filters are reported on a per sample basis.

The following are commonly requested reporting limits:

*Sample Specific Detection Limit or Sample Detection Limit (SDL)* – determined individually for every sample analysis run by converting the area equivalent of 3.0 times (2.5 times for EPA 1600 series methods) the estimated chromatographic noise height to a concentration in the same manner that target peak responses are converted to final concentrations. The SDL accounts for any effect of matrix on the detection system and for recovery achieved through the analytical work-up. Equivalent term(s): Estimated Detection Limit (EDL) from EPA method 8290.

*Method Detection Limit (MDL)* - determined as specified by EPA Fed. Reg. 40 CFR Part 136 Appendix B (no iteration option). The 99% confidence level MDL is determined based on analysis of a minimum of 7 replicate matrix spikes fortified at 1-10 times the estimated detection limit. MDL is determined as required based on accreditation, contract and workload requirements.

*Lower Method Calibration Limit (LMCL)* - determined by prorating the concentration of the lowest calibration limit for sample size and extract volume. The following equation is used. ((lowest level cal conc.) x (extract volume))/sample size. Typical extract volume for aqueous and tissue samples is 100 µL for all other matrices typical extract volume is 500 µL.

For the analysis of PAHs AXYS standard is to report sample concentrations using the SDL as the reporting limit.

## **QUALITY ASSURANCE/QUALITY CONTROL**

All samples are analyzed in batches with the following composition:

- Batch Size - Each batch consists of up to twenty test samples and additional QC samples.
- Blanks - One procedural blank is analyzed for each batch. The procedural blank is prepared by spiking an aliquot of the surrogate standard solution into a clean matrix.
- On-going Precision and Recovery (OPR) Samples – On-going Precision and Recovery (OPR) is demonstrated by the analysis of a spiked reference matrix (SPM) analyzed with each batch. The reference sample to be analyzed is assigned to the analyst when the batch is assigned. The OPR sample is prepared by spiking an aliquot of the authentic spiking solution into an accurately weighed in-house reference matrix (known to contain low background levels of target analytes). The matrix is spiked with an aliquot of surrogate standard solution and, after an equilibration time of at least 30 minutes is extracted.
- Duplicates - Sample duplicates are analyzed (provided sufficient sample is available) for batches with 7-20 test samples, or when specified by the contract. For some matrices (XAD columns, filters, air samples) only field duplicates (if available) can be analyzed.
- Reference Samples – Certified reference materials are commercially available and are used to validate and periodically check methods. Additionally reference samples may be analyzed with a batch at the client's request.

The batch composition may vary according to batch or quality control requirements specified by a client. Each batch is carried through the complete analytical process as a unit. For sample data to be reportable the batch QC data must meet the acceptance criteria.

**QC Specification Table: Authentic and Surrogate Standard Recoveries, OPR and Samples**

MATRIX	Typical Sample Specific* Detection Limits						Procedural Blank Level (ng)	Acceptable Matrix Spike % Recovery

**% RECOVERY RANGES**

**ALL MATRICES**

**QC Specification Table: Instrumental Analysis, and Analyte Quantification**

<b>Parameter</b>	<b>Acceptance Specification</b>
<b>Procedural Blank</b>	Refer to Table "QC Specification Table: Authentic and Surrogate Standard Recoveries, OPR and Samples" above, or 5 times lower than analogous analyte value detected in the samples.
<b>Analysis Duplicate</b>	Duplicates must fall within $\pm 20\%$ of the mean (applicable to concentrations >10 times the DL) These are guidelines – departures based on professional judgement allowed.
<b>Instrument Sensitivity</b>	S/N 3:1 for 10 pg of acenaphthene, dibenzo(a,h)anthracene.
<b>Instrument Resolution</b>	Calibration gas PFTBA (FC43) unit mass resolution at m/e 69/70 and 219/220, Unit mass resolution is demonstrated by the presence of a resolved peak at m/z 70 and m/e 220.
<b>Instrument Linearity</b>	Linearity is demonstrated by a 5-point calibration over the working concentration range with a relative standard deviation of the RRFs $\leq 20\%$ for targets with a labelled analog present and all labelled compounds, $\leq 35\%$ for targets with no labelled analog present.
<b>Bracketing Cal</b>	RRFs for the opening and closing calibrations over a 12 hour period must agree to within +/- 20% of the mean (ie <40 RPD between RRFs and for the opening and closing calibrations).
<b>Continuing Cal Ver</b>	Opening Cal Ver: Concentrations of native compounds and labelled surrogates must be within $\pm 25\%$ of expected values for all targets. Closing Cal Ver: Concentrations of native compounds must be within $\pm 25\%$ of expected values. Concentrations of labelled surrogates must be within $\pm 25\%$ of expected values, with any two (2) values allowed to be within $\pm 40\%$
<b>GC Resolution</b>	Benzo[b] & [k]fluoranthene valley height must be $\leq 75\%$ for equal concentrations. Phenanthrene/anthracene valley height must be $\leq 30\%$ for equal concentrations.
<b>Chromatogram Quality</b>	Maximum peak width must be $\leq 15$ seconds for dibenzo[ghi]perylene peak at 10% peak height.
<b>Retention Time Window for Target Compounds</b>	RT within $\pm 3$ seconds of the predicted retention time determined from the calibration standard and adjusted relative to the peak retention time reference (i.e. labelled surrogate). A second requirement is that an authentic elute after its labelled analog.
<b>Ion Abundance Ratios</b>	CAL VER: Ion ratios for dibenz[ah]anthracene, indeno[1,2,3-cd]pyrene and benzo[ghi]perylene must be within $\pm 35\%$ of the mid-point of the I-CAL All other native analytes and labelled surrogates must be $\pm 20\%$ of the mid-point of the I-CAL  Samples: Ion ratios for dibenz[ah]anthracene, indeno[1,2,3-cd]pyrene and benzo[ghi]perylene must be within $\pm 35\%$ of the 12 hour CAL (CAL VER or Bracketing) calibration standard. All other native analytes and labelled surrogates must be $\pm 20\%$ of the 12 hour CAL (CAL VER or Bracketing) calibration standard.

## APPENDIX – SUMMARY OF MODIFICATIONS TO EPA 8270C, 8270D AND 1625B

Analysis by GC/LRMS, Key Attributes of AXYS MLA-021, EPA 8270C/D and EPA 1625B

## **Appendix E**

### **Benthic Invertebrate Communities and Sediment Quality Component**

---

## **E BENTHIC INVERTEBRATE COMMUNITIES AND SEDIMENT QUALITY COMPONENT**

### **E.1 BENTHIC INVERTEBRATE COMMUNITIES**

The objective of this appendix is to provide technical details on laboratory methods used for the processing and identification of the benthic samples. This appendix also documents the calculations used to estimate the *baseline* ranges of variability for benthic invertebrate community measurement endpoints that were used in Section 5 as a measure against which to assess the significance of temporal trends in *test* reaches.

#### **E.1.1 Benthic Invertebrate Sample Processing Procedures**

##### **E.1.1.1 Laboratory Methods**

In preparation for laboratory processing, samples were checked upon arrival to the laboratory to ensure that they were adequately sealed, labeled and that the preservative had effectively penetrated the entire sample. Samples were then rinsed of the residual fine debris and preservative (provided a minimum exposure of 72 hours to formalin occurred). Samples were either sorted immediately, or transferred to 80% ethanol, prior to sorting and taxonomic work. After sorting and identification, freshwater macro-invertebrates were stored in a solution of 70 to 80% ethanol, and 5% glycerin in vials or jars with airtight lids.

To expedite the sorting process, samples with large pieces of organic matter were divided into appropriate size fractions in the laboratory. The most commonly used fractions were coarse ( $> 1.00$  mm) and fine (250  $\mu\text{m}$  - 1.00 mm), which corresponded to the divisions used to define coarse and fine particulate organic matter (CPOM and FPOM), respectively. Where there were very large pieces of organic material or large invertebrates, they were separated from the rest of the sample with a 4.00-mm sieve. All fractions were sorted. If warranted by large numbers of organisms, the fractions were sub-sampled (as described below). After the initial washing and fractionation of samples, the invertebrates were sorted from the debris by trained technicians on a gridded tray or petri dish under a dissecting microscope at 10X to 20X magnification. Samples that contained large amounts of debris, or large numbers of animals were further sub-sampled as per Figure E.1-1.

##### **E.1.1.2 Coarse Fraction**

The coarse fraction (contents of the 2-mm and 1-mm sieves) was transferred into individual containers and 70 % alcohol added, prior to sorting. At least  $\frac{1}{4}$  of the coarse fraction was sorted, with the amount of material sorted determined either by volume or weight.

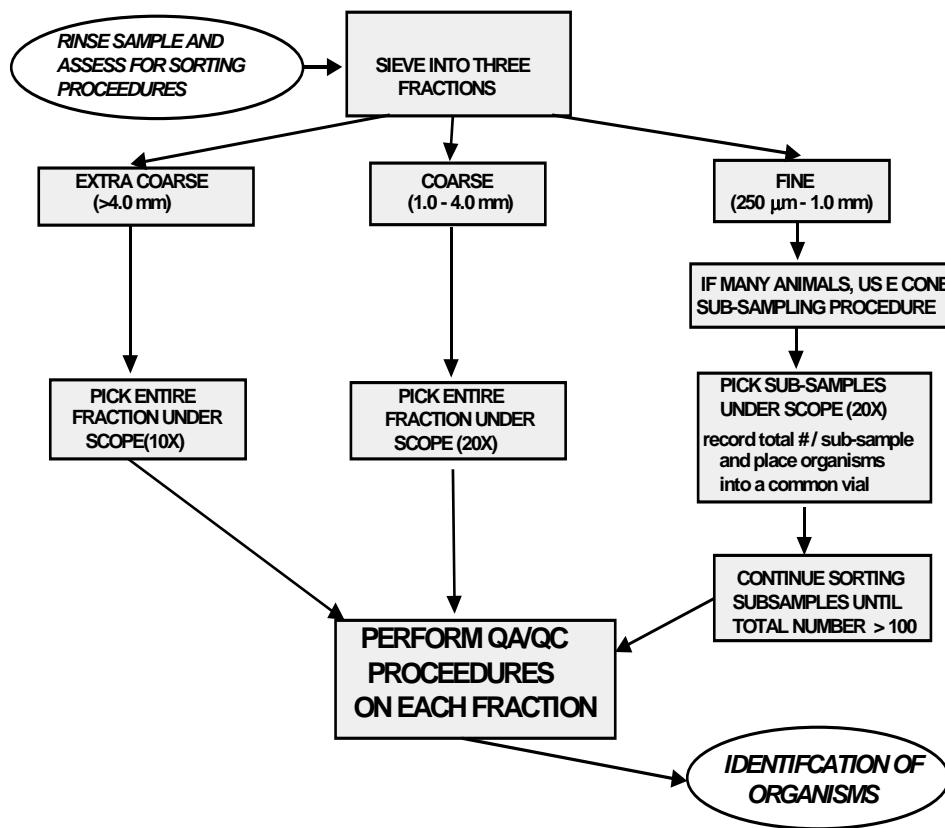

##### **E.1.1.3 Fine Fraction**

The fine fraction (contents of 0.180-mm sieve) was transferred into a 2-L container for decanting. Warm water was added to the 2-L container, swirled and decanted to mobilize organic material into a 0.180 mm sieve. This was repeated until all organic material was washed out of the sand. The sand was scanned under magnifying glass for heavy-shelled or stone-cased animals.

When there was a lot of organic material in the fine fractions and/or large numbers of organisms, a sub-sampling of the fine fractions was done as described below.

The fine fraction was sorted in its entirety when possible. When there were large amounts of the fine fraction, the material was sub-sampled using an Imhoff cone and bubbler (Wrona *et al.* 1982). Either  $\frac{1}{4}$  of the sample was sorted, or at least 100 animals were removed from the debris. The fine fraction was stained with haematoxalin or rose Bengal to improve sorting.

**Figure E.1-1 Benthic invertebrate sorting and sub-sampling protocol, applicable for samples with large detrital material and large numbers of small organisms.**

Note: This is an illustrative example only, which should be modified as necessary for station-specific samples.

#### E.1.1.4 Identification

Invertebrates were identified using recognized taxonomic keys (Brooks and Kelton 1967, Teskey 1969, Edmunds *et al.* 1976, Oliver and Roussel 1983, Wiederholm 1983, McCafferty and Randolph 1998, Stewart and Stark 1988, Brinkhurst 1989, Pennak 1989, Clifford 1991, Merritt and Cummins 1996, Westfall and May 1996, Wiggins 1996, Zloty and Pritchard 1997, Epler 2001). Animals were identified to the lowest practical level, typically genus with the exception of Oligochaeta, which were identified to family (see Table E.1-1). Small, early-instar or damaged specimens were identified to the lowest level possible, generally to family.

**Table E.1-1     Level of taxonomic identification.**

Group	Level
Nematoda	Phylum
Oligochaeta	Family
Gastropoda	Genus/Species
Turbellaria	Family
Hirudinea	Species
Mollusca	Genus/Species
Hydracarina	Left at this level
Cladocera	Left at this level
Copepoda	Order
Ostracoda	Leave at this level
Amphipoda	Genus
Insecta	Genus/Species
Terrestrial	Left at this level

Organisms that require detailed microscopic examination for identification (e.g., Chironomidae and Oligochaeta) were mounted onto microscope slides using an appropriate mounting media (e.g., Canada balsam, Permount, Hohers's). The most common species that were distinguishable on the basis of gross morphology were mounted less frequently as double checks. All rare or less commonly occurring species are mounted for identification.

### E.1.2    Calculating Baseline Ranges

Though rigorous analyses of variance can be used to test for changes related to oil sands operations by comparison of *test* watercourses to those that are not, the RAMP design has considerable statistical power, and thus the potential to detect changes that are negligible. The variability observed in regional *baseline* locations can be used to set observed changes into context, as per Kilgour *et al.* (1998). Watercourses were classified as either erosional or depositional river reaches, or a lake, and the “*baseline* range of variability” for *baseline* watercourses were calculated within each of those habitat types. Observed variations in *test* watercourses were then compared to the observed range of variability for *baseline* watercourses.

As in the main report, the following measurement endpoints were calculated:

- Total abundance (No. individuals/m<sup>2</sup>);
- Richness (number of distinct taxa);
- Simpson's Diversity;
- Evenness; and
- % EPT (percent of the fauna as Ephemeroptera, Plecoptera and Trichoptera).

*Baseline* ranges for abundance, richness, diversity, evenness, and percent EPT were derived based on habitat type (erosional, depositional, lake) and are provided in the relevant figures for each reach or lake in the main body of the report.

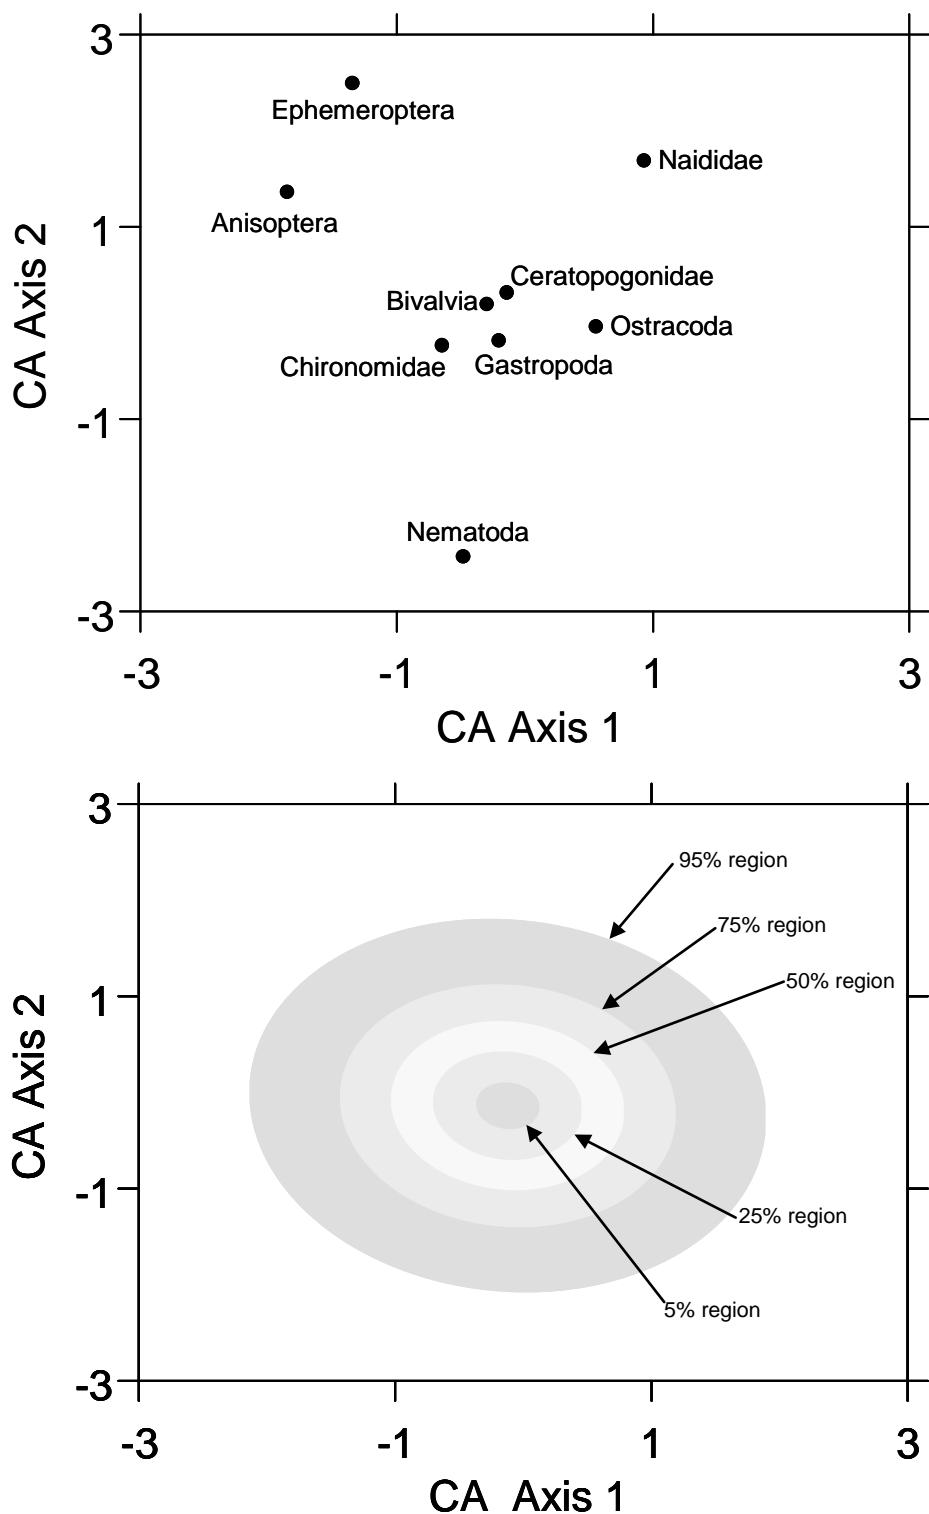

Correspondence Analysis (CA), a multivariate ordination procedure was also used. CA ordinates the data such that the biplots of reach scores represents the similarities among reaches. Reaches close together in the biplots have similar fauna, while reaches far apart tend to have fewer similarities in their fauna. CA also orders the taxa, and biplots of taxa can be overlain over the biplots of reaches. The position of taxa in the biplots indicates, roughly, the samples in which taxa are their most abundant. The CA was generated using data from both *baseline* and *test* watercourses. Separate analyses were performed for depositional river reaches, erosional river reaches, and for lakes, on the basis that those three habitat classes contained very different types of benthic invertebrates as determined from analyses from previous years. Differences in composition among those three basic habitat types were borne out again this year.

With CA, the configuration of ordination diagrams tends to be sensitive to rare taxa (Gauch 1982). Therefore, the taxonomy was summarized to family level identifications and only those taxa (i.e., families) found in at least 10% of samples from a system were retained for the analysis. Taxa abundances were  $\log_{10}$ -transformed prior to analysis. The CA was conducted using an MS Excel<sup>®</sup> add-in (Biplot 1.1; Lipkovich and Smith 2002).

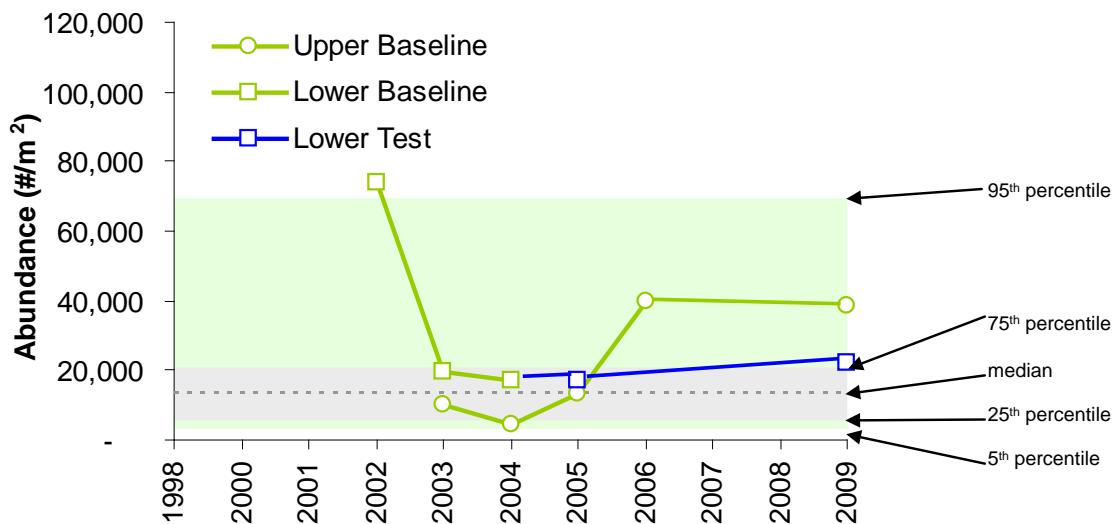

The ordination was carried out using data for all available samples. Average CA axis scores were then computed for each reach (or lake) – year combination. CA annual-average axis scores were illustrated in a biplot, with a 95% confidence ellipse around the *baseline* data. Reaches that fall outside the ellipse for the *baseline* watercourses could be considered to be unusual, and that may be considered evidence of an effect (Kilgour *et al.* 1998).

*Baseline* data were identified for lake and river habitats. The *baseline* range of variation was non-parametrically computed as the range of values that included the 5<sup>th</sup> and 95<sup>th</sup> percentiles for each of abundance, number of taxa, diversity, evenness and percent EPT for each of lake, erosional river and depositional river habitats (similar to what is done with the water quality data; and see Figure E.3-1). The ordination axis scores were treated somewhat differently. The normal range of variation was depicted as an ellipse in a biplot of the first two CA axes with the *baseline* range being defined parametrically as the region enclosing the 95% region, equivalent to a non-parametric estimate of the 95<sup>th</sup> percentile (Figure E.3-2). The Athabasca River delta was considered unique in the analysis because there were no true regional *baseline* reaches that provided a truly adequate comparison. In this report, the *baseline* condition for the delta habitat was considered to be all of the previous data from 1998 to 2010. This approach to estimating *baseline* conditions was roughly equivalent to control charting techniques that are designed to determine when processes are “out of control” (Shewart 1931).

**Figure E.1-2** Example biplot showing time trend of benthic invertebrate CA Axis scores in relation to the baseline range of variation, in this case, for samples from the Athabasca River delta.

**Figure E.1-3 Example time trend chart for benthic invertebrate community abundance in relation to the *baseline* range of variation, in this case, for a depositional reach.**

## E.2 SEDIMENT QUALITY COMPONENT

### E.2.1 Analytical Methods

Analytical methods used for sediment quality analysis for RAMP in 2011, along with associated detection limits and analysis-specific Variable Method Values (VMV codes, where available and provided by the laboratories) are presented in Table E.2-1.

For PAHs specifically, AXYS Analytical Ltd. used their AXYS Method MLA021 for the determination of concentrations of PAHs, and alkylated PAHs in solid (sediment, soil) and equipment rinsate (aqueous) matrices. This method is based upon USEPA Methods 1625 and 8270, with modifications. AXYS Analytical is accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA) (Lab ID A2637) in Canada for the analysis of PAHs in solids.

All samples for PAH analysis were spiked with a solution of fifteen deuterated surrogate standards prior to analysis. Solid samples were extracted by soxhlet extraction. Aqueous samples were solvent-extracted. The sample extracts were fractionated on a silica gel chromatographic column and analyzed using capillary column gas chromatography with detection by low resolution mass spectrometry (GC/MS) for PAHs and alkylated PAHs. The GC/MS was operated at unit mass resolution. Concentrations were reported in ng/g on a dry weight basis for solids and ng/L for aqueous samples.

Detection limits for each PAH analysis varied based on surrogate and spike recoveries and other internal laboratory QA/QC measures conducted for each test. However, detection limits for individual PAH species were dependent on the species.

## E.2.2 Predicted PAH Toxicity

PAH toxicity in sediments was estimated using an equilibrium-partitioning method described by Neff *et al* (2005). Hydrocarbons are present in sediments as complex mixtures of compounds with widely varying physical, chemical and toxicological properties. PAHs found in aquatic environments originate from three possible sources, and can generally be identified by the composition of the PAH mixture within the sediments (Neff *et al* 2005, USEPA 2003):

- *Pyrogenic PAHs*, which result from the incomplete but high-temperature, short duration combustion of organic matter, and are most abundant in non-alkylated (parent) form;
- *Petrogenic PAHs*, which are created by the application of relatively low temperatures over geologic time scales, and are most abundant in alkylated form; and
- *Diagenic / Biogenic PAHs*, which are formed from biological precursors such as plants, bacteria, fungi, and animals, and result in the production of compounds such as retene, perylene and derivatives of phenanthrene and chrysene.

PAHs present in the Athabasca oil sands region can be categorized as being derived from petrogenic sources, as indicated by the significantly higher concentrations of alkylated PAHs relative to parent PAHs.

During development of this report, the method employed by the US Environmental Protection Agency (USEPA) and described in USEPA (2003) for calculating potential PAH toxicity of sediments also was considered as a comparison to hazard index values obtained using the Neff *et al* method. Calculations used for both methods are similar in that they compare measured PAH concentrations to PAH-specific toxicities, estimate bioavailability, and use these individual toxicity and bioavailability estimates to produce an aggregate hazard value for the sum of all PAHs in a sample. However, the USEPA method normalizes PAHs to the total organic fraction of sediment (rather than the total non-aqueous-phase-liquids [NAPL] fraction), and uses fewer individual PAH measurements than the Neff *et al.* method. Additionally, the USEPA method focuses heavily on the contribution of parent PAHs to sediment toxicity, given it was developed for assessment of sediments containing predominantly pyrogenic PAHs. Given sediments in the Athabasca oil sands region are primarily petrogenic and dominated by alkylated PAHs rather than parent species, the USEPA method may underestimate potential toxicity of oil-sands-affected sediments. Additionally, the standard PAH package employed by RAMP does not include the entire list of PAHs required to accurately calculate toxicity using the USEPA method. For these reasons, results obtained from the USEPA method were not considered in this report.

Estimation of PAH toxicity in sediments was conducted using methods described by Neff *et al* (2005). This method incorporates 41 individual PAH compounds into the PAH toxicity calculation. PAH concentrations are distributed between three phases in sediments: dissolved (pore water), particulate (sediment and organic matter), and non-aqueous-phase-liquids (NAPL: an oil coating associated with sediment particles and comprised of hydrocarbons such as petroleum). The fraction of PAHs in solution are much more bioavailable and toxic than those complexed to sediment particles via the other two phases. Neff *et al.* (2005) state that PAHs have a higher affinity to the NAPL phase (estimated by RAMP using total recoverable hydrocarbons measured in each

sample) than to the other two phases of sediments and are; therefore, quickly deposited into sediments. Consequently, each individual PAH concentration measured in a sediment sample is first normalized to total recoverable hydrocarbons to produce an estimate of the combined PAH concentration available within the pore water and particulate fractions of sediments:

$$PAH_{(normalized)} = \frac{PAH \text{ concentration}}{\text{total recoverable hydrocarbons}}$$

where:

- $PAH_{(normalized)}$  refers to the estimate of PAHs available in pore water and complexed to the particulate fraction of sediment;
- PAH concentration refers to the absolute concentration of specific PAH species; and
- Total recoverable hydrocarbons (TRH) refers to the total amount of hydrocarbons representing NAPL. TRH was measured directly by RAMP from 1997 to 2004, and replaced in 2005 by the more detailed, higher-resolution measure, CCME total hydrocarbons, with both methods overlapping in 2004. To allow long-term comparisons using data from 2005 onward, TRH in each sample was estimated using the concentration of CCME total hydrocarbons adjusted using the following equation, which was based on direct within-sample comparisons made using 2004 data:

$$TRH = \text{total CCME hydrocarbons} * 2.183$$

where,

Total CCME hydrocarbons are equal to the sum of CCME Fractions 2 to 4.

$PAH_{(normalized)}$  concentrations then are divided by the octanol/water partition coefficient ( $K_{ow}$ ) to estimate the concentration of each PAH that is bioavailable in the dissolved (pore water) phase of sediment. These estimates are divided by a chronic toxicity value (compiled from Mackay *et al.* 1992, Neff and Burns 1996, Ran *et al.* 2002, and references cited in Neff *et al.* 2005) to produce a hazard quotient (HQ) for each PAH measured in the sediment sample:

$$HQ = \left( \frac{PAH_{(normalized)}}{K_{ow}} \right) \div \text{Chronic Toxicity}$$

Finally, all HQs calculated using this method are summed to produce a hazard index (HI) for total PAHs in sediment pore water:

$$HI = \sum HQ$$

Sediments with a calculated hazard index value greater than 1.0 have the potential to be toxic to aquatic organisms (Neff *et al.* 2005).

**Table E.2-1 Analytical methods, method detection limits, and Variable Method Values (VMV codes) for sediment quality variables measured by analytical laboratories for RAMP in 2011.**

## F FISH POPULATIONS COMPONENT

### F.1 COMMON AND SCIENTIFIC NAMES FOR FISH SPECIES CAPTURED IN THE 2011 FISH POPULATIONS COMPONENT

**Table F.1-1 Common and scientific names for fish species captured during Fish Populations component activities, 2011.**

Common Name	Scientific Name	Code
Arctic grayling	<i>Thymallus arcticus</i>	ARGR
brook stickleback	<i>Culaea inconstans</i>	BRST
burbot	<i>Lota lota</i>	BURB
emerald shiner	<i>Notropis atherinoides</i>	EMSH
flathead chub	<i>Platygobio gracilis</i>	FLCH
goldeye	<i>Hiodon alosoides</i>	GOLD
lake chub	<i>Couesius plumbeus</i>	LKCH
lake whitefish	<i>Coregonus clupeaformis</i>	LKWH
longnose dace	<i>Rhinichthys cataractae</i>	LNDC
longnose sucker	<i>Catostomus catostomus</i>	LNSC
mountain whitefish	<i>Prosopium williamsoni</i>	MNWH
northern pike	<i>Esox lucius</i>	NRPK
pearl dace	<i>Semotilus marginatus</i>	PRDC
slimy sculpin	<i>Cottus cognatus</i>	SLSC
spoonhead sculpin	<i>Cottus ricei</i>	SPSC
spottail shiner	<i>Notropis hudsonius</i>	SPSH
trout-perch	<i>Percopsis omiscomaycus</i>	TRPR
walleye	<i>Sander vitreus</i>	WALL
white sucker	<i>Catostomus commersoni</i>	WHSC
yellow perch	<i>Perca flavescens</i>	YLPR

## F.2 EXTERNAL HEALTH ASSESSMENT INDEX CODES FOR FISH EXAMINATION

Fish body part and abnormality codes were developed to assess the health of captured fish in a rapid process to minimize the fish holding time in the field (Table F.2-1). Fish body part and abnormality codes were also developed to assess the internal health of fish captured for dissection and tissue analyses. For each abnormality that was observed, the severity of the abnormality was recorded (1-mild; 2-moderate; 3-severe) as well as the location of the abnormality (Table F.2-2).

**Table F.2-1 External and internal health assessment codes for fish examinations.**

Variable	Variable Code	Variable Condition	Variable Condition Code
eyes	EYE	no aberrations; good "clear" eye	N
		exophthalmia (popeye)	EX
		blind; an opaque eye (one or both)	BL
		cloudy cornea	CC
		lens deformed	LD
		lens parasites	LP
		lens cataract	LC
		hemorrhaging or bleeding in the eye (one or both)	HM
		missing one or both eyes	MI
		other; any condition not covered above	OT
gills	GIL	normal; no apparent aberrations	N
		frayed; erosion of tips of gill lamellae resulting in "ragged" gills	FR
		clubbed; swelling of the tips of gill lamellae	CL
		marginate; gills with light, discoloured margin along tips the lamellae	MA
		pale; very light in colour	DI
		parasites	PA
		gas bubbles	GB
		other; any condition not covered above	OT
pseudobranchs	PSD	normal; flat, containing no aberrations	N
		swollen; convex in aspect	SW
		lithic; mineral deposits, white, somewhat amorphous spots	LI
		other; any condition not covered above	OT
thymus	THY	no hemorrhage	0
		hemorrhagic	HM
		other; any condition not covered above	OT

**Table F.2-1 (Cont'd.)**

<b>Variable</b>	<b>Variable Code</b>	<b>Variable Condition</b>	<b>Variable Condition Code</b>
skin	BOS	normal; no skin aberrations	N
		lesion	LE
		raised or missing scales	RM
		reoriented scales	RS
		swollen	SW
		exceeds mucus	EX
		growths and/or tumours	GR
		parasites	PA
		wounds and/or scars	WO
		other; any condition not covered above	OT
fins	FIN	no active erosion	N
		frayed-eroded	FE
		parasites	PA
		hemorrhagic	HM
		gas bubbles	GB
		other; any condition not covered above	OT
opercle	OPR	no shortening	N
		incomplete	IN
		other; any condition not covered above	OT
hindgut	ANU	normal; no inflammation or reddening	N
		inflamed	IN
		other; any condition not covered above	OT
body deformities	BOF	none	N
		emaciated	EM
		truncate	TR
		scoliosis	SC
		lordosis	LO
		other; any condition not covered above	OT
mesenteric fat	MF	none	0
		< 50 % coverage of mesentery	1
		50 % coverage of mesentery	2
		> 50 % coverage of mesentery	3
		100% of mesentery covered	4

**Table F.2-1 (Cont'd.)**

<b>Variable</b>	<b>Variable Code</b>	<b>Variable Condition</b>	<b>Variable Condition Code</b>
liver	LI	normal; solid red or light red colour	A
		"fatty" liver; "coffee with cream" colour	C
		nodules in the liver; cysts or nodules	D
		focal discolouration; distinct localized colour changes	E
		general discolouration; colour change in whole liver	F
		other; any condition not covered above	OT
spleen	SP	normal; black, very dark red, or red	B
		granular; rough appearance of spleen	G
		nodular; containing fistulas or nodules of varying sizes	D
		enlarged; noticeable enlarged	E
		other; any condition not covered above	OT
gall bladder	GA	normal	0
		enlarged	1
		parasites	2
kidney	KI	normal; firm dark red colour, lying relatively flat along vertebral column	N
		swollen; enlarged or swollen wholly or in part	S
		mottled; gray discolouration	M
		granular; granular appearance and texture	G
		urolithiasis/nephrocalcinosis; white/cream mineral material in tubules	U
		other; any condition not covered above	OT
parasites	PA	no observed parasites	0
		few observed parasites	1
		moderate parasite infestation	2
		numerous parasites	3

**Table F.2-2 Codes for the location of external fish abnormalities.**

Variable	Location	Code
Body surface	fins	1
	head	2
	eyes	3
	mouth	4
	peduncle	5
	ventral	6
	dorsal	7
	lateral	8
Fins	dorsal	1
	pectoral	2
	pelvic	3
	anal	4
	adipose	5
	caudal	6
Eyes	right	1
	left	2

**Appendix G**

**Acid-Sensitive Lakes Component**

---

## **G ACID-SENSITIVE LAKES COMPONENT**

Appendix H presents the descriptive portions of the Acid-Sensitive Lakes (ASL) component for 2011. Summary statistics on the chemistry of the ASL component lakes (RAMP lakes), results of between-year comparisons of measurement endpoints, calculations of critical loads of acidity for each lake, and trend analyses on the measurement endpoints can be found in Section 5.12. Appendix H includes the following:

- Water yields and runoff estimates for the individual RAMP lakes;
- A test of the assumption that current base cation concentrations are the same as historical base cation concentrations in the RAMP lakes for the critical load calculations;
- Origin of the use of an  $\text{ANC}_{\text{lim}}$  of 75  $\mu\text{eq}/\text{L}$  in the critical load calculations;
- The chemistry of the 50 RAMP lakes in 2011 compared to the 450 lakes within the oil sands region reported by the  $\text{NO}_x\text{SO}_x$  Management Working Group (NSMWG);
- The characterization of the ion chemistry of the RAMP lakes in 2011 using Piper plots; and
- A summary of the trace metal concentrations in the RAMP lakes and the relationships between metal concentrations, lake location and water chemistry.

Estimates of the seasonal variability in measurement endpoints were not presented this year as in previous years given that the five-year seasonal sampling program, sponsored by CEMA and conducted by Alberta Environment and Water (AEW), ended in 2008. For estimates of seasonal variability in the measurement endpoints in the RAMP lakes, see Appendix H in the 2008 Technical Report (RAMP 2009a).

### **G.1 RUNOFF CALCULATIONS FOR EACH RAMP LAKE**

The runoff ( $Q$ ) to each lake, was calculated from analyses of heavy isotopes of oxygen ( $^{18}\text{O}$ ) and ( $^2\text{H}$ ) in each lake conducted by John Gibson (University of Victoria). With this technique, the natural evaporative enrichment of  $^{18}\text{O}$  and  $^2\text{H}$  in each lake is used to partition water losses between evaporation and liquid outflow to derive an estimate of runoff (Gibson 2002, Gibson *et al.* 2002, Gibson and Edwards 2002, Gibson *et. al.* 2010). This isotopic mass balance technique (IMB) utilizes a different set of assumptions from traditional hydrometric methods, which extrapolate water yields from one or more gauged catchments to the ungauged lake catchments.

The water yields for each lake catchment and the runoff to each lake are provided in Tables G.1-1 and G.1-2. The runoff is calculated from the water yield by incorporating the lake catchment areas and represents the discharge that would be measured at the lake outlet. In 2011, the runoff values using the IMB method were unavailable. The average yield and runoff values from 2002 to 2010 were; therefore, applied in calculating the critical loads for 2011. The runoff estimates for the ASL lakes ranged from  $0.001 \text{ m}^3/\text{s}$  to  $2.431 \text{ m}^3/\text{s}$  (median:  $0.077 \text{ m}^3/\text{s}$ ). As noted in the Tables G.1-1 and G.1-2, the runoff for an individual lake can vary considerably between years. The median coefficient of variation of the runoff over all 50 ASL lakes over the years 2002 to 2010 was 36.4 %. As noted by Gibson *et al.* (2010), yearly variations in the yield and runoff to a lake will have a direct effect on its critical load and acid sensitivity.

**Table G.1-1 Water Yields to the RAMP lakes, 2002 to 2011<sup>1</sup>.**

Lake ID No.	AEW Label	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	Lake Area (km <sup>2</sup> )	Catchment Area (km <sup>2</sup> )

## **G.2 TEST OF THE ASSUMPTION THAT CURRENT BASE CATIONS ARE SIMILAR TO HISTORIC BASE CATIONS IN THE RAMP LAKES**

During the process of acidification of a catchment, base cations are released from the soils to lake waters. In applying the Henriksen model, it was assumed that base cations have not increased in the RAMP lakes as a result of acidic deposition; that is, the current base cation concentrations ( $BC_T$ ) are equivalent to the original base cation concentrations ( $BC_0$ ).

The discrepancy between the original and the current base cation concentrations in a lake is normally calculated using an equation from Braake *et al.* (1990) based on increases in concentrations of sulphur in a lake resulting from aerial deposition. The study by Henriksen *et al.* (2002) on lakes in Ontario gives an example on the use of this equation. To test the assumption that the base cations have not changed significantly in the RAMP lakes,  $BC_0$  was calculated for each lake using the equation in Braake *et al.* (1990). A value of S (one of the terms in the equation) equal to 400  $\mu\text{eq}/\text{L}$  and an original sulphate concentration of 1.67  $\mu\text{eq}/\text{L}$  (corresponding to the 5<sup>th</sup> percentile of sulphate concentrations) were used in the calculations. As in the Henriksen *et al.* (2002) study, an F value of 1 was applied when the base cation concentrations were greater than 400  $\mu\text{eq}/\text{L}$ . Table G.2-1 showed that the discrepancy between  $BC_0$  and  $BC_T$  over the 50 lakes was small although greater than observed in 2010. The mean discrepancy between the calculated original base cation concentration and measured base cation concentration was 8.3%. The largest discrepancies were found in four lakes located in the Birch Mountain subregion (lakes 454, 455, 457, 464). When these four lakes were eliminated, the mean discrepancy between the two estimates was 5.7%. The four lakes in the Birch Mountain subregion were relatively high in sulphate. The high sulphate levels in these lakes are likely natural in origin rather than from acid deposition given that the Birch Mountain subregion is remote from major sources of acidic emission. The assumption of using the current base cation concentrations for the original base cation concentrations appears to be valid. The assumption is further supported by a recent study by Whitfield *et al.* (2010) in which the Magic Model was applied to soils in the oil sands region. This study concluded that, to date, sulphate deposition levels in the oil sands region have resulted in only a limited removal of base cations from the soil.

### G.3 ORIGIN OF THE USE OF $\text{ANC}_{\text{lim}} = 75 \mu\text{eq/L}$ IN THE CRITICAL LOAD CALCULATIONS

The limiting critical load ( $\text{ANC}_{\text{lim}}$ ) of 75  $\mu\text{eq/L}$  used in calculating the critical loads was derived in a study by WRS (2001) using regional data from 180 lakes and relates to Environment Canada's assumption that a pH > 6 is required to maintain a healthy aquatic ecosystem.

The critical load concept assumes a dose-response relationship between a water quality variable and an aquatic indicator organism. In this case, the water quality variable is the acid neutralizing capacity (alkalinity) required to maintain a healthy fish population. In applying the Henriksen model in Europe, a critical threshold ANC ( $\text{ANC}_{\text{lim}}$ ) was set to protect brown trout, the most common European salmonid and ensure that no toxic acidic episodes occur to this species during the year. The  $\text{ANC}_{\text{lim}}$  was derived from a survey of water chemistry data, critical load exceedances and fish population status in 1000 lakes in Norway in 1986 (Henriksen *et al.* 1988, Lien *et al.* 1992). A value of 20  $\mu\text{eq/L}$  seemed to be the most appropriate for evaluating critical loads in Norway and this value has been adapted by most of the Scandinavian countries (Henriksen *et al.* 1992).

In North America, the effects of acidification on fish have been historically related to pH rather than ANC. Research on pH tolerance of a wide range of aquatic organisms has shown that a pH > 6 is required to maintain aquatic ecosystem function and protect both fish and other organisms (RMCC 1990, Environment Canada 1997, Jeffries and Lam 1993). Within a given region, lake pH has been empirically and theoretically related to ANC (alkalinity) as an inverse hyperbolic sine function (Small and Sutton 1986) and this relationship has been used to equate the two variables for the purpose of critical load modelling (e.g., Jeffries and Lam 1993). A similar approach was taken in the WRS study to estimate  $\text{ANC}_{\text{lim}}$  (WRS 2001). The relationship between pH and alkalinity was derived for 180 lakes surveyed by ALPAC in 1998 (Figure G.3-1). For simplicity, a logarithmic function was fitted to the data. Interpolation indicated that over the given population of lakes, a pH of 6.0 was associated with an alkalinity of ~75  $\mu\text{eq/L}$ . This value was therefore chosen for  $\text{ANC}_{\text{lim}}$ .

**Figure G.3-1 Lake pH vs. alkalinity for 180 regional lakes.**

## G.4 COMPARISON OF RAMP LAKE CHEMISTRY IN 2011 TO REGIONAL LAKES

In order to determine how representative the RAMP lakes are of regional lake chemistry, water chemistry in 2011 in the RAMP lakes was compared to a database of 450 lakes within the oil sands region reported by the NO<sub>x</sub>SO<sub>x</sub> Management Working Group (NSMWG). The two populations are compared statistically in Table G.4-1 and selected variables are presented graphically in box plots (Figure G.4-1). Key results are as follows:

- The RAMP lakes covered a slightly narrower pH range (4.40 to 9.42), with a lower median value (6.80 vs. 6.93). The median pH of the RAMP lakes was significantly less than that of the NSMWG regional database ( $p<0.05$ );
- Total alkalinity in the RAMP lakes ranged from 0  $\mu\text{eq}/\text{L}$  to 1,894  $\mu\text{eq}/\text{L}$  with a median of 258  $\mu\text{eq}/\text{L}$ , which was much lower than the regional median of 1,020  $\mu\text{eq}/\text{L}$ . The median total alkalinity across the RAMP lakes in 2011 was significantly lower than that in the NSMWG database ( $p<0.05$ );
- Conductivity was relatively low in the RAMP lakes, ranging from 11  $\mu\text{S}/\text{cm}$  to 183  $\mu\text{S}/\text{cm}$  (median: 36  $\mu\text{S}/\text{cm}$ ). The median for conductivity in the regional database was 125  $\mu\text{S}/\text{cm}$ . The median conductivity of the RAMP lakes in 2011 was significantly lower than that of the regional lakes ( $p<0.05$ );
- Consistent with the lower conductivity in the RAMP lakes, the mean and median concentrations of the principal cations (calcium, magnesium, sodium and potassium) and the sum of base cations (SBC) were all less than the values in the NSMWG database. Median SBC in the RAMP lakes in 2011 was 446.8  $\mu\text{eq}/\text{L}$  compared to 1,247  $\mu\text{eq}/\text{L}$  in the regional lakes. The median values of these variables were all significantly less in the RAMP lakes ( $p<0.05$ );
- The mean and median concentrations of the major anions (chloride, sulphate and titration bicarbonate) were all less than those in the regional database;
- Total phosphorus was quite variable in the RAMP and regional lake database with individual lakes attaining concentrations that would classify them as eutrophic or hypereutrophic (Wetzel 2001). The highest concentration of phosphorus observed in the RAMP lakes in 2011 was 208  $\mu\text{g}/\text{L}$  in Lake 457/BM 5 in the Birch Mountains subregion. The highest concentration of phosphorus in the regional lake database was 495  $\mu\text{g}/\text{L}$ . The median concentration of phosphorus in the RAMP lakes was 41.0  $\mu\text{g}/\text{L}$  compared to 49.0  $\mu\text{g}/\text{L}$  in the regional lakes database. There was no significant difference in the median concentration of total phosphorus between the RAMP lakes in 2011 and the regional lakes; and
- Concentrations of nitrate in the RAMP lakes were generally low (median: 8.14  $\mu\text{g}/\text{L}$ ), although several lakes had values two orders of magnitude greater than the median (e.g., 223  $\mu\text{g}/\text{L}$  in Lake 457/BM 5 in the Birch Mountains). Concentrations of nitrate in the regional lakes database were similarly variable with a median of only 2  $\mu\text{g}/\text{L}$ , with some lakes having concentrations as high as 1,860  $\mu\text{g}/\text{L}$ . Unlike previous years, the median concentration of nitrate was significantly greater in the RAMP lakes than in the regional lake database ( $p<0.05$ ).

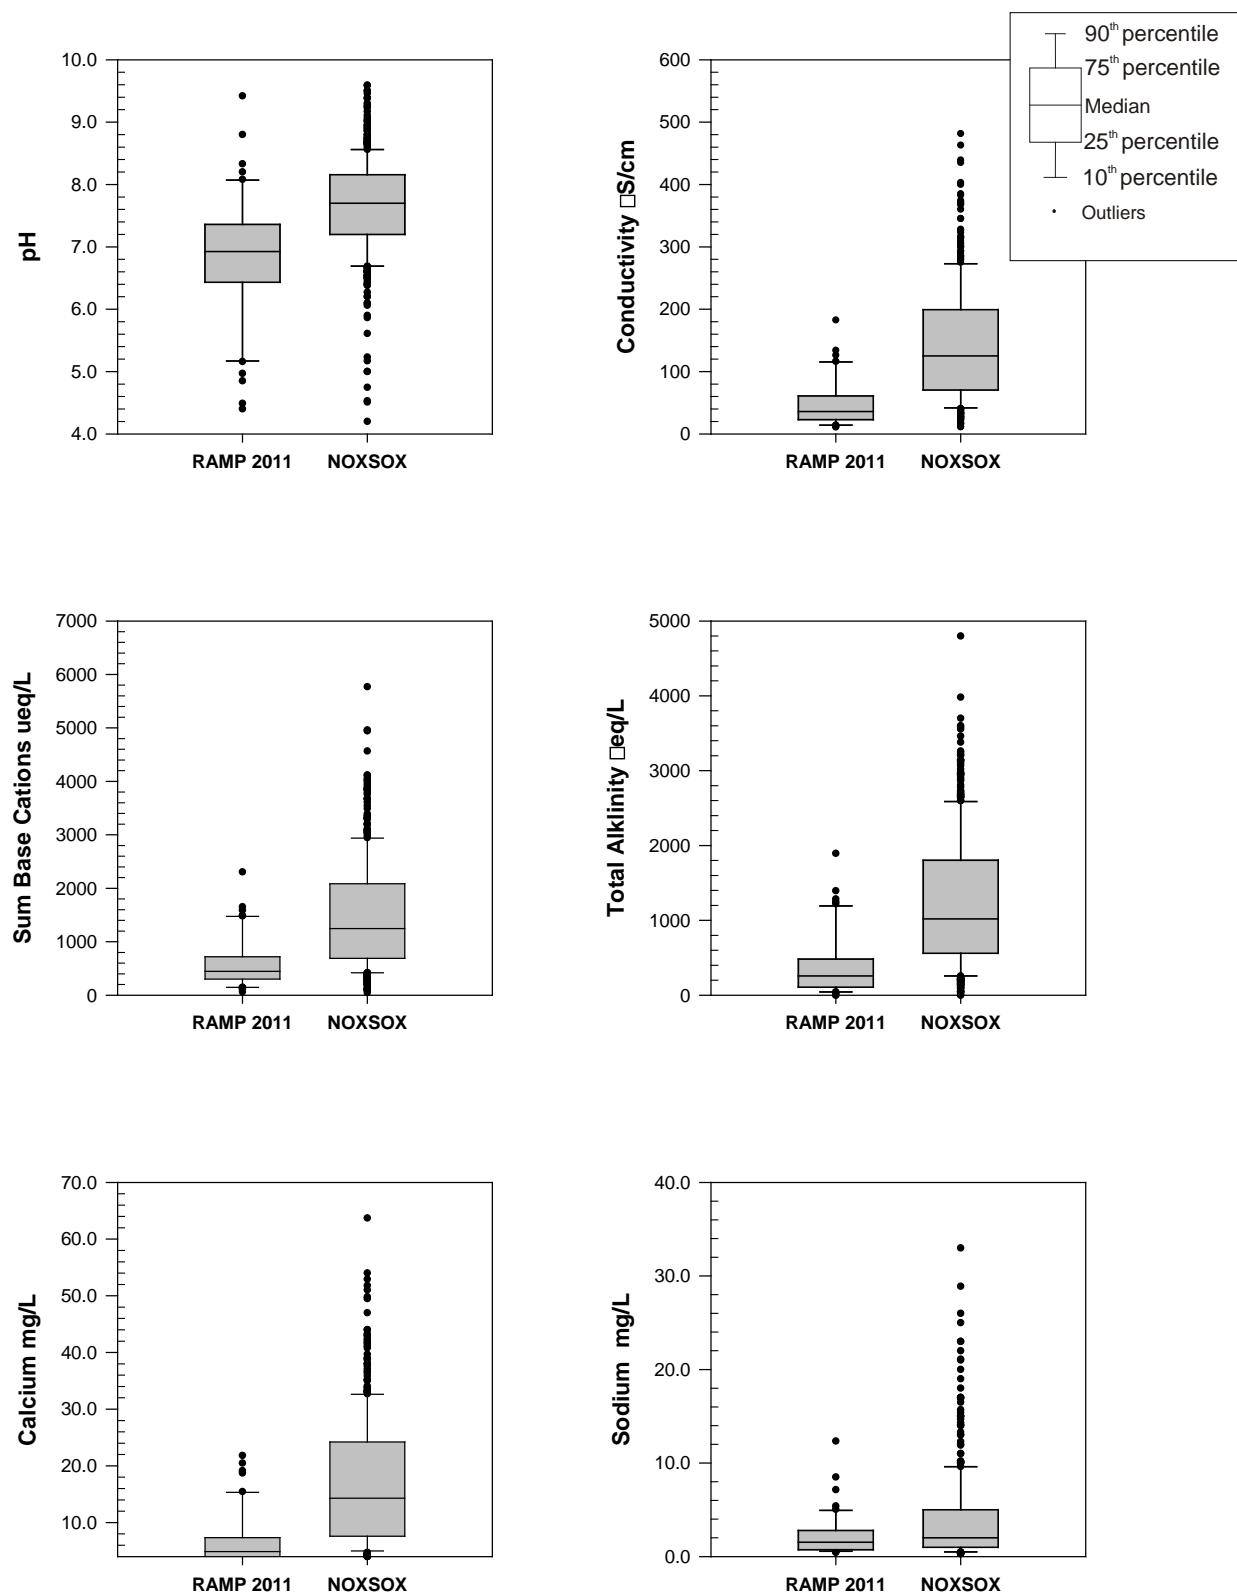

The chemical differences between the RAMP lakes and the regional lakes reflect the bias in the selection process for lakes in the RAMP ASL component. In the initial stages of the program, The RAMP lakes were selected for their acid-sensitivity which, in practice, meant selecting lakes with the lowest pH, alkalinity and conductivity. These types of lakes are often the smallest lakes and are often located in the upland regions where catchments are dominated by fens and organic soils.

**Table G.4-1 Comparison between RAMP lakes in 2011 and 450 regional lakes in the NSMWG database.**

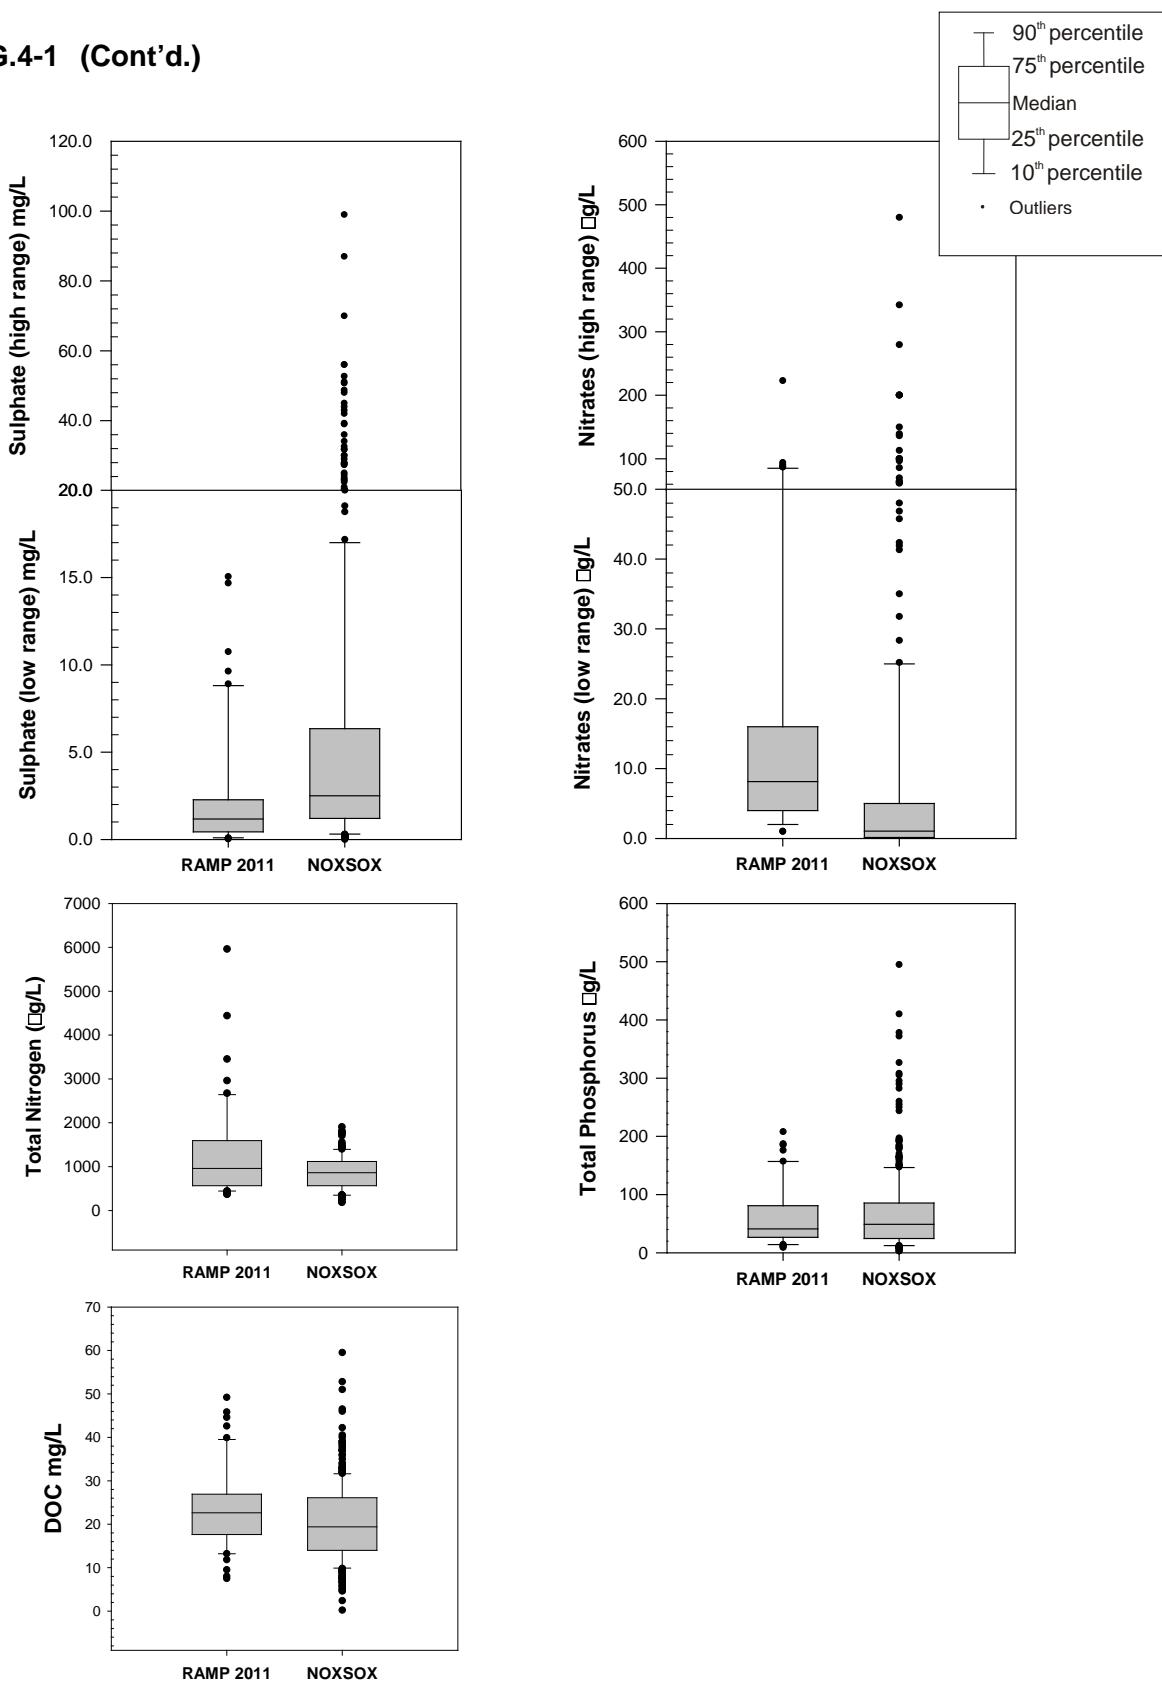

Variable	Units	RAMP Lakes (2011)				Regional Lakes				
		Min	Max	Median	Mean	No.	Min	Max	Median	Mean

**Figure G.4-1 (Cont'd.)**

## G.5 CHARACTERIZATION OF ION CHEMISTRY IN THE RAMP LAKES

In order to characterize water in RAMP lakes, the major anions and cations were displayed in Piper plots (Figure G.5-1). A Piper diagram is a multivariate graphical technique that is used to divide the lakes into four water types on the basis of major cation constituents (Guler *et al.* 2002, Freeze and Cherry 1979, Back and Hanshaw 1965):

- Type I  $\text{Ca}^{2+}$  -  $\text{Mg}^{2+}$  -  $\text{HCO}_3^-$ ;
- Type II  $\text{Na}^+$  -  $\text{K}^+$  -  $\text{HCO}_3^-$ ;
- Type III  $\text{Na}^+$  -  $\text{K}^+$  -  $\text{Cl}^-$  -  $\text{SO}_4^{2-}$ ; and
- Type IV  $\text{Ca}^{2+}$  -  $\text{Mg}^{2+}$  -  $\text{Cl}^-$  -  $\text{SO}_4^{2-}$ .

In 2011, the Piper diagrams showed that the majority of the lakes were of the Ca-Mg-Bicarbonate type (Type I). In 2011, eight lakes had greater than 40% of the anion charge attributable to sulphate and chloride rather than bicarbonate and carbonate and tended towards the Type IV water type (Table G.5-1). Most of these lakes are found in the Birch Mountains and Stony Mountains subregions and are small (in both area and volume), low in Gran alkalinity (poorly buffered), pH, conductivity and relatively high in DOC. Three lakes, located in the Birch Mountains, Canadian Shield and Northeast of Fort McMurray subregions, in 2011 had over 40% of the cationic charge attributable to sodium and potassium (Table G.5-2).

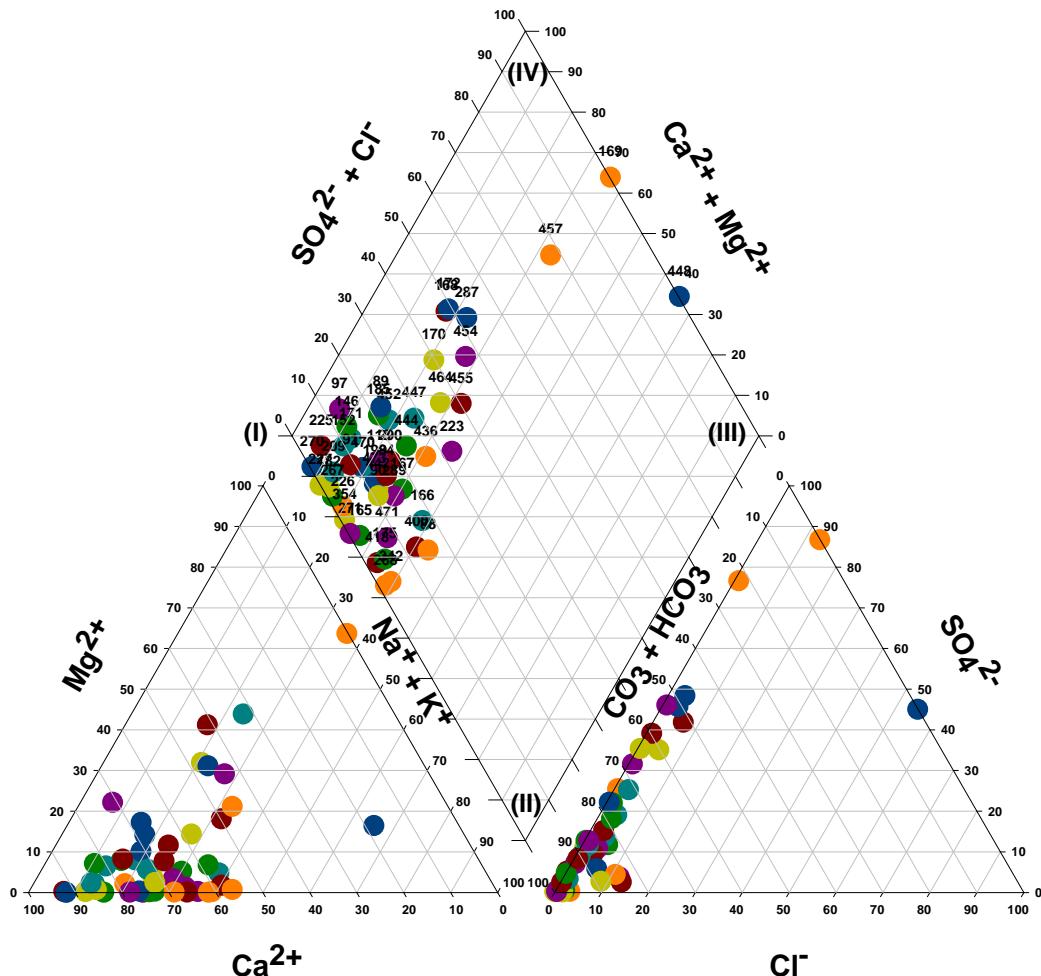

**Table G.5-1 Key chemical characteristics of RAMP lakes having greater than 40% of anion charge attributable to sulphate and chloride.**

Lake	AEW Name	pH	Gran Alkalinity ( $\mu\text{eq/L}$ )	Conductivity ( $\mu\text{S/cm}$ )	DOC (mg/L)	Lake Area ( $\text{km}^2$ )

## **G.6 ANALYSIS OF METALS IN THE RAMP LAKES**

Elevated metals concentrations, in particular aluminum, have served as important indicators of lake acidification. Concentrations of metals in the RAMP lakes for the past 10 years are in the RAMP database and summarized in Table G.6-1 and Table G.6-2 for the total and dissolved fractions, respectively. Table G.6-3 presents the mean concentration of each trace metal for the lakes in each subregion.

In general, concentrations of trace metals were quite low and many were less than the detection limit. Table G.6-3 shows that the highest concentrations of trace metals were found in the upland regions, particularly in the Birch Mountains and the Stony Mountains subregions. In the Birch Mountains, 60 individual metals in 11 lakes had mean concentrations greater than the 95<sup>th</sup> percentile for all lakes (Table G.6-3). The regional distribution of dissolved aluminum, iron and cobalt in the RAMP lakes clearly showed the higher concentrations of trace metals in these upland regions (Figure G.6-1 to Figure G.6-3). The lakes with the highest concentrations of metals included those identified in the Piper plots as having more than 40% of the anionic charge attributable to chloride and sulphate rather than bicarbonates (Figure G.5-1, Table G.5-1).

The reasons for the higher concentrations of metals in the upland regions are unclear but may be related to the relatively low mean pH in these lakes (Table G.6-4). The high concentrations of chlorides/sulphates, as well as high concentrations of barium in the Birch Mountain lakes, also suggested a potential groundwater source for these metals. The relatively high concentrations of metals in these lakes are natural in origin rather than the result of emissions from regional industry.

The number of exceedances of CCME surface water quality guidelines for the protection of aquatic life in 2011 and the associated lakes are provided in Table G.6-5. Exceedances were observed for aluminum, iron and cadmium, copper and lead. The guideline exceedances were scattered throughout the various subregions, with a large number from lakes in the Birch Mountains subregion, which was consistent with the high concentrations of metals found in this subregion. Concentrations of cadmium exceeded the water quality guideline in ten lakes. As the CCME guideline for cadmium (0.018 µg/L; hardness of 50 mg/L) is extremely low, exceedances of this metal occur occasionally in surface waters in the Athabasca oil sands region. The exceedances in Table G.6-5 were considered to be natural occurrences.

**Table G.6-1 Statistical summary of total trace metals in the RAMP lakes, 2011 to 2011.**

For the purposes of calculating statistics, non-detectable metal concentrations were assumed to be one-half of the detection limit reported by the laboratory. Shaded values are non-detectable with the value in each cell equivalent to one-half of the detection limit.

For the purposes of calculating statistics, non-detectable metal concentrations were assumed to be one-half of the detection limit reported by the laboratory. Shaded values are non-detectable with the value in each cell equivalent to one-half of the detection limit.

**Table G.6-3 Mean concentrations of total and dissolved trace metals in the RAMP lakes in each subregion, 2001 to 2011.**

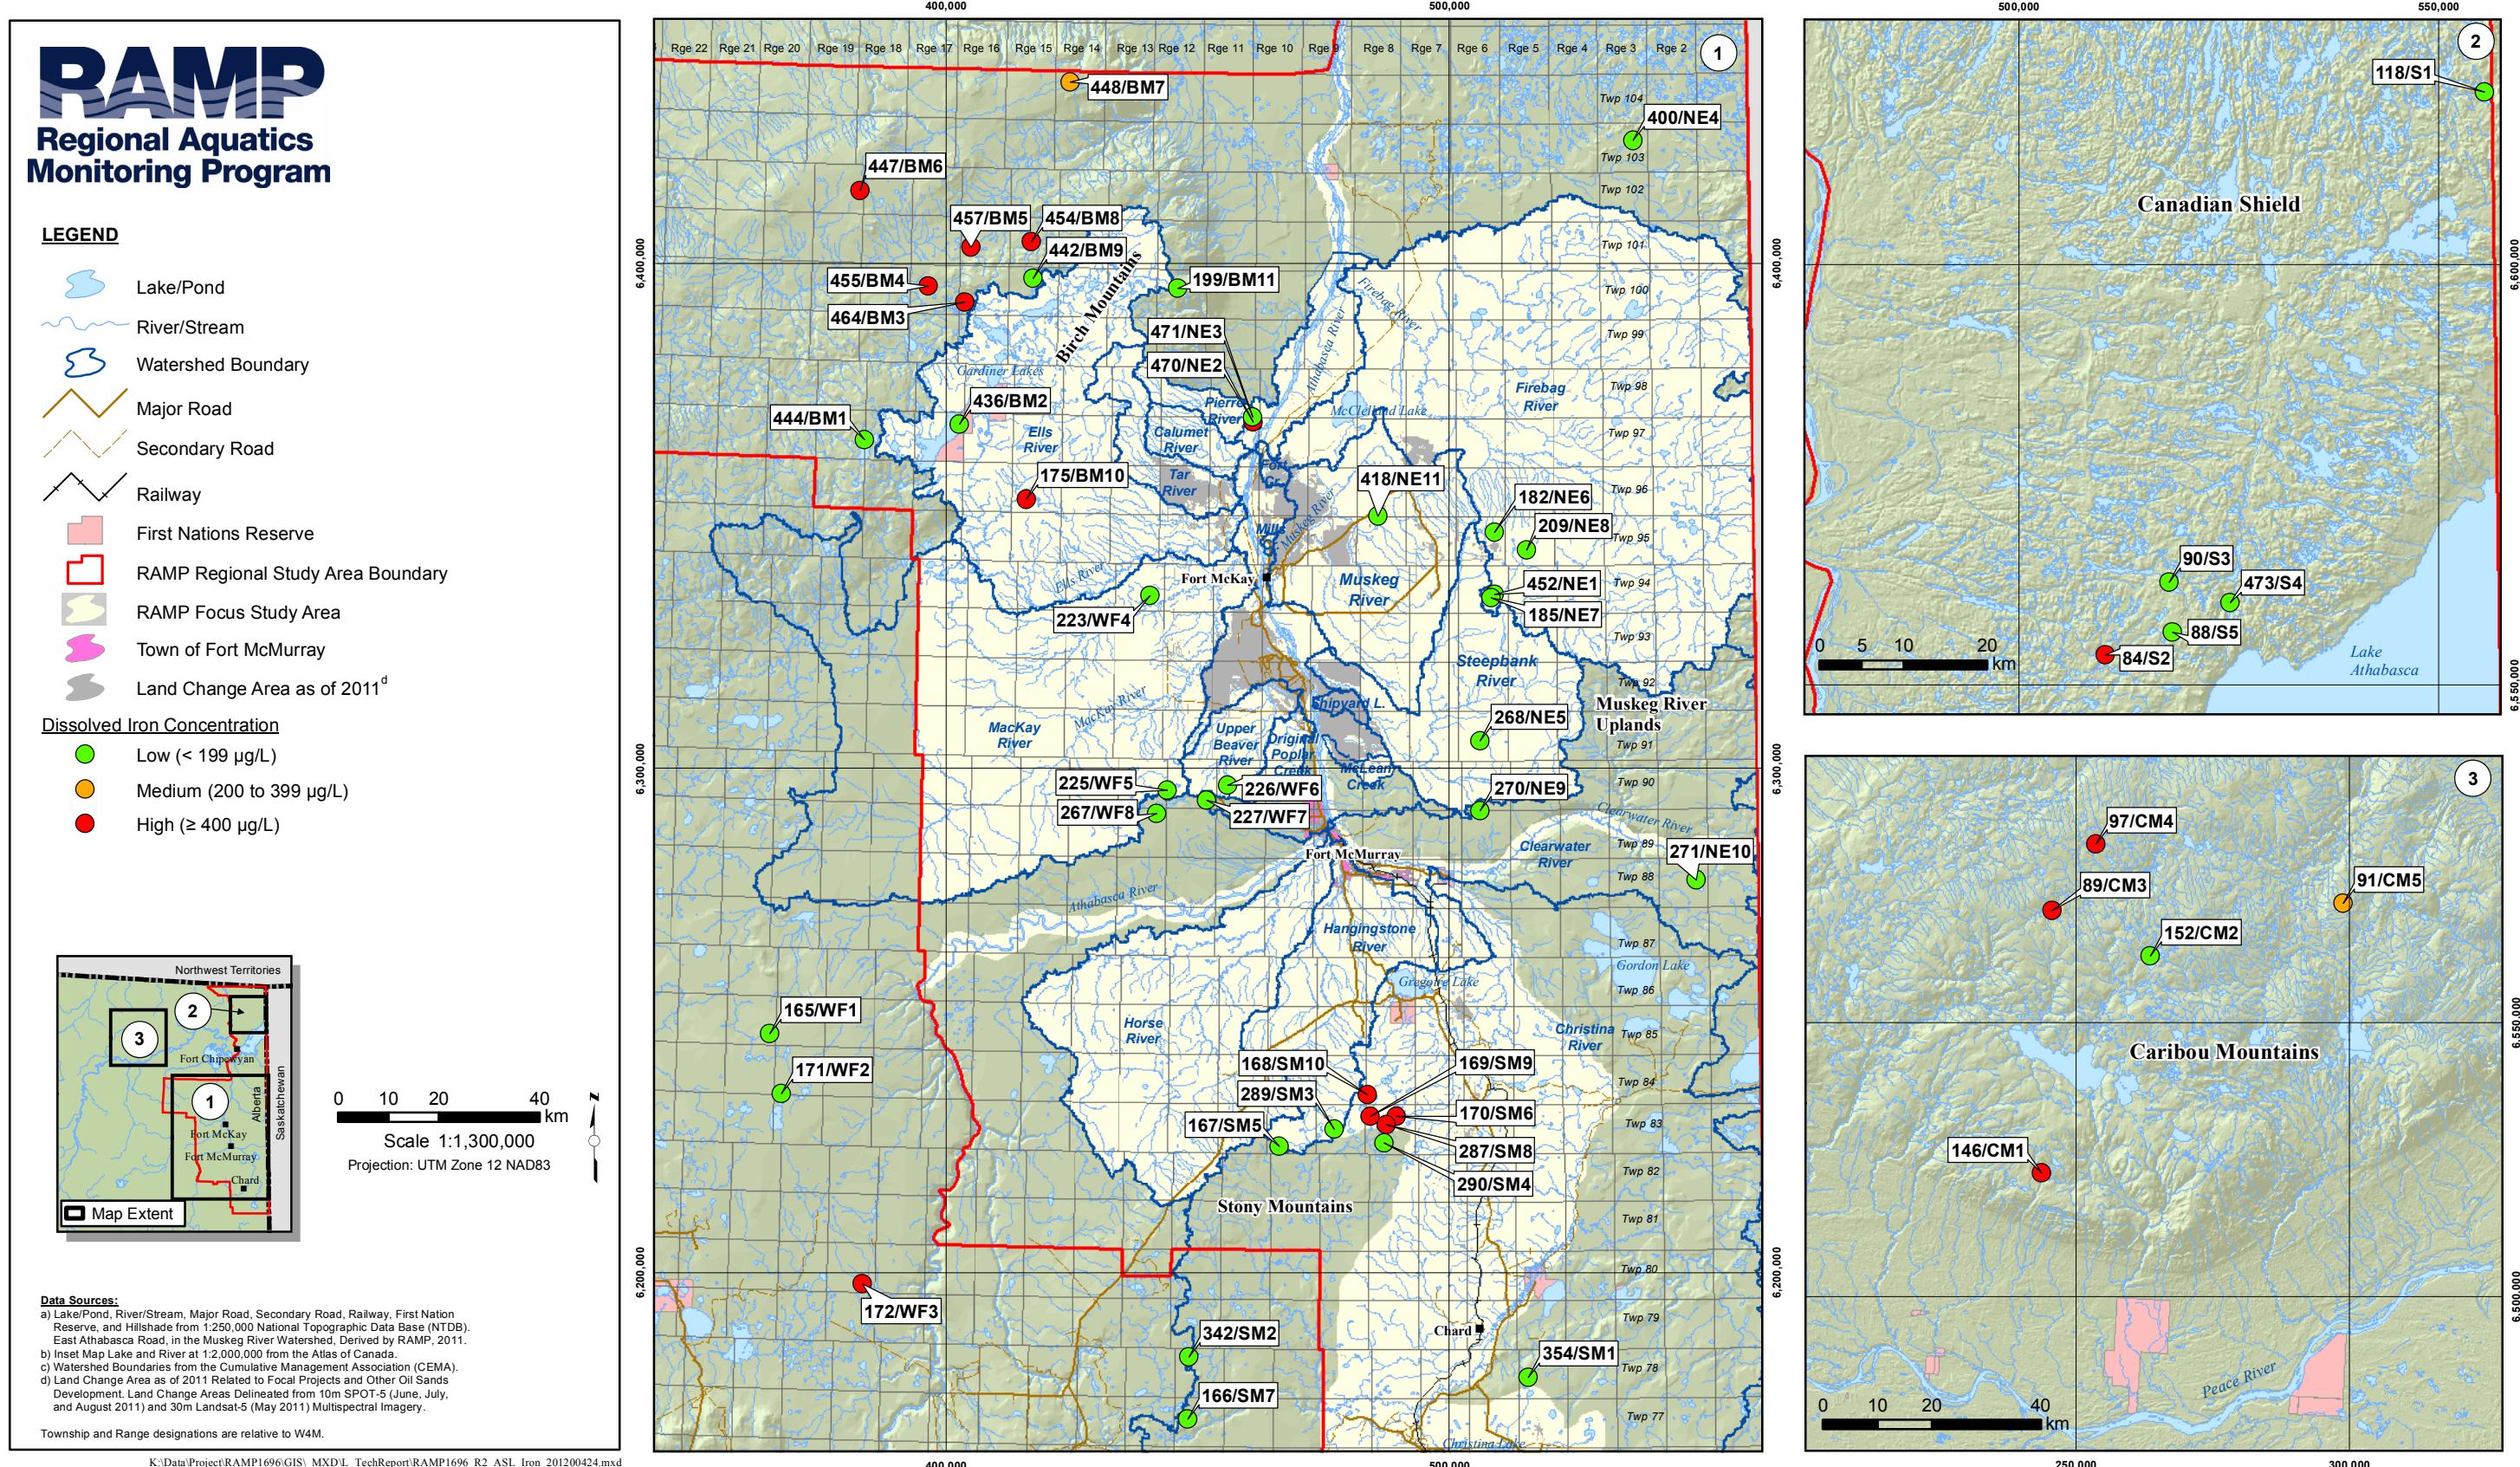

Metal	Mean Concentrations µg/L - Dissolved Metals						Mean Concentrations µg/L - Total Metals
